

## Finding the min and max

- Lower Bound Theorem: Finding the minimum and maximum in a set of  $n$  integers requires at least  $\text{ceil}(3n/2) - 2$  comparisons.
- Proof: Adversary argument

CS140 8-1

## MIN/MAX Adversary - Accounting

- Adversary = interactive comparison oracle
- Accounting scheme: For  $x$  in  $S$

$$b_{\text{MAX}}(x) = \begin{cases} 1 & \text{if the algorithm can rule out} \\ & x \text{ as the largest integer} \\ 0 & \text{otherwise} \end{cases}$$

$$b_{\text{MIN}}(x) = \begin{cases} 1 & \text{if the algorithm can rule out} \\ & x \text{ as the smallest integer} \\ 0 & \text{otherwise} \end{cases}$$

## MIN/MAX Adversary - Strategy

- On query  $x < y$  ?
- Answer consistently with previous answers
- If yes and no both consistent then answer so as to minimize the changes in the MAX/MIN variables

CS140 8-3

## MIN/MAX Adversary - Analysis

Consider query  $x < y$ ?

- If YES:  $b_{\text{MIN}}(x) \rightarrow 1$  and  $b_{\text{MAX}}(y) \rightarrow 1$
- If NO:  $b_{\text{MAX}}(x) \rightarrow 1$  and  $b_{\text{MIN}}(y) \rightarrow 1$

CS140 8-4

## MIN/MAX Adversary – proof of bound

- Claim: At most  $\text{floor}(n/2)$  queries can result in the change of two  $b$  variable
- Claim:  $2n-2$  changes must occur before the algorithm concludes

➡  $\text{floor}(n/2) + 2n - 2 - 2\text{floor}(n/2)$  queries are needed before the algorithm can halt.
