

Outline

- A lower bound for comparison-based sorting
- Linear time sorting

9/13/00

CS140(S)

1

Run Time Bounds

Upper bounds on the *Worst Case* running times of sorting algorithms:

- Bubble-sort: $O(n^2)$
- Modified Bubble-sort: $O(n^2)$
- Insertion-sort: $O(n^2)$
- Merge-sort: $O(n \log(n))$
- Heap-sort: $O(n \log(n))$
- Quick-sort: $O(n^2)$

9/13/00

CS140(S)

2

Run Time Bounds cont.

Lower bounds on the *Worst Case* running times of sorting algorithms:

- Bubble-sort: $\Omega(n^2)$
- Modified Bubble-sort: $\Omega(n^2)$
- Insertion-sort: $\Omega(n^2)$
- Merge-sort: $\Omega(n \log(n))$
- Heap-sort: $\Omega(n \log(n))$
- Quick-sort: $\Omega(n^2)$

9/13/00

CS140(S)

3

Comparison-based sorting

A comparison-based sorting algorithm is one that doesn't need to read the input, provided it is given the size of the input and a comparison oracle.

9/13/00

CS140(S)

4

Lower Bound for Sorting

Theorem: Any comparison-based sorting algorithm has a worst-case running time that is $\Omega(n \log(n))$.

9/13/00

CS140(S)

5

Proof of Theorem

A decision tree describes the queries of a comparison-based algorithm on input size n .

A root to leaf path represents the sequence of queries for a particular input.

9/13/00

CS140(S)

6

Proof of Theorem cont.

Each leaf corresponds to the permutation that sorts the input.

Proof cont.

- There must be at least $n!$ leaves.
- A binary tree with $n!$ leaves has a path with length at least $\log(n!)$.
- By Stirling's approximation
 $\log(n!) = \Omega(n \log(n))$.

Outline

- A lower bound for comparison-based sorting
- **Linear time sorting**

Sorting in $O(n)$

Can we do it?

Yes – but only if we can make some assumptions about the input.

Some examples:

- Counting-sort
- Radix-sort
- Bucket-sort

Counting-sort(S)

- Assumption: The input integers are in the range $[0..B]$, where B is some constant.
- For $i=0$ to B : $\text{Count}(i)=0$
- For $i=1$ to n : $\text{Count}(S(i))++$
- For $i=1$ to B : For $j=1$ to $\text{count}(i)$: Write i

Counting-sort

- Is it correct?
 - Yes
- Is it fast?
 - $O(n+B)$ but B is constant so $O(n)$

Radix-sort

- Assumption: The input are decimal integers with exactly D digits, where D is some constant.
- For $i=1$ to D
 - Use counting-sort to sort S based on i^{th} digit using current order to break ties. (Least significant digit is digit 1.)

13

Radix-sort(S)

- | | | | |
|-------|-------|-------|-------|
| • 329 | • 720 | • 720 | • 329 |
| • 457 | • 355 | • 329 | • 355 |
| • 657 | • 436 | • 436 | • 436 |
| • 839 | • 457 | • 839 | • 457 |
| • 436 | • 657 | • 355 | • 657 |
| • 720 | • 329 | • 457 | • 720 |
| • 355 | • 839 | • 657 | • 839 |

9/13/00

CS140(S)

14

Radix-sort

- Is it fast?
 - $O(Dn)$ but D is constant so $O(n)$
- Is it correct?
 - Loop invariant: The **red numbers** are sorted.

9/13/00

CS140(S)

15

Radix-sort(S)

- | | | | |
|-------|-------|-------|-------|
| • 329 | • 720 | • 720 | • 329 |
| • 457 | • 355 | • 329 | • 355 |

| • 355 | • 839 | • 657 | • 839 |

9/13/00

CS140(S)

16

Bucket-sort(S)

- Assumption: The input are uniformly distributed in the range $[0..1)$.
- Initialize buckets $B[0..n-1]$ to nil
- For $i=1$ to n
 - Insert $S[i]$ into the sorted list at $B[\lfloor n \cdot S[i] \rfloor]$
 - Output the concatenated buckets

9/13/00

CS140(S)

17

Bucket-sort

- Is it correct?
 - Yes
- Is it fast?
 - The expected running time is $O(n)$.

Average-case analysis

What does average-case mean?

- **Deterministic algorithm with a known input distribution**
- Randomized algorithm on any (i.e. worst-case) input

A brief tour of (discrete) probability theory...

- Sample space and elementary events
- Discrete probability distributions
- Discrete random variables
- Expectation

The experiment

- A fair coin is flipped
- Sample space: {Head, Tail}

The experiment

- Two fair coins are flipped
- Sample space: {HH, HT, TH, TT}

Discrete Probability Distribution

Assigns a real number to outcomes:

- Experiment 1: $P(H)=P(T)=1/2$
- Experiment 2:
 $P(HH)=P(HT)=P(TH)=P(TT)=1/4$

Discrete Probability Distribution

- $P(A) \geq 0$
- $P(S) = 1$
- $P(A \cup B) = P(A) + P(B)$ when A and B are disjoint events.

Discrete Random Variable X

- Sample space is a finite set of real numbers.
- X is the outcome of the experiment
- Probability distribution: $P(X=x)$
- Expected value of X:
 $E[X] = \sum_{x \in S} x P(X=x)$
 $E[X^2] = \sum_{x \in S} x^2 P(X=x)$
 $\text{Var}(X) = E[(X-E[X])^2]$

9/13/00

CS140(S)

25

Example

- A unfair coin is tossed n times:
 $P(H)=p, P(T)=1-p=q$
- X is the number of heads
- $P(X=k) = C(n,k)p^kq^{n-k}$
(Binomial distribution)
- $E[X] = np$
- $E[X^2] = npq + n^2p^2$

9/13/00

CS140(S)

26

Bucket-sort(S)

- Let T be the number of comparisons made by the algorithm on a random input of size n.
- Claim: $E[T] = O(n)$

9/13/00

CS140(S)

27

Analysis

- Let X_i be the number of input that belong in bucket i. X_i is binomially distributed with $p=1/n$.
- $T \leq c \sum_{i=0..n-1} X_i^2$
- $E[T] \leq c \sum_{i=0..n-1} E[X_i^2]$
 $= c \sum_{i=0..n-1} (npq + n^2p^2) = O(n)$.
