CS140(12)

1

Self-Reduction

10/23/00

CS140(12)

2

Reduction: $A \propto B$

10/23/00

CS140(12)

3

Reduction: $A \propto B$

10/23/00

CS140(12)

4

Some reductions we've seen

- Sorting \propto Find-max
- General Selection \propto Find-median
- Almost every dynamic programming problem

10/23/00

CS140(12)

5

To solve A

- One Stage
 - Self-Reduction
- Two Stage
 - Define B
 - Reduce A to B
 - Solve B using self-reduction

10/23/00

CS140(12)

6

Longest Increasing Subsequence

- Input: Sequence of integers $X: x_1, x_2, \dots, x_n$
- Output: Longest increasing subsequence of X ; i.e. a subsequence $Z: z_1, z_2, \dots, z_k$ such that $z_i < z_{i+1}$ for each $i: 1 \dots k-1$.

10/23/00

CS140(12)

7

Example

- 1, -3, 2, 10, 8, 23, -2, 17, 5

10/23/00

CS140(12)

8

$$\text{LIS}_{n+1} \infty \text{LIS}_n$$

Don't know how to do it!!!

10/23/00

CS140(12)

9

To solve A

- **Define B** (Strengthen the inductive hypothesis)
- Reduce A to B
- Solve B using self-reduction

10/23/00

CS140(12)

10

LIS and Modified LIS

- Input: Sequence of integers $X: x_1, x_2, \dots, x_n$
- Output: Longest increasing subsequence

- Input: Sequence of integers $X: x_1, x_2, \dots, x_n$
- Output: For each $i: 1 \dots n$, a longest increasing subsequence of x_1, \dots, x_i that ends in x_i .

10/23/00

CS140(12)

11

MLIS(x_1, \dots, x_n)

MLIS(x_1, \dots, x_n) =

1. LIS of x_1 that ends in x_1
2. LIS of x_1, x_2 that ends in x_2
- ⋮
- n-1. LIS of x_1, \dots, x_{n-1} that ends in x_{n-1}
- n. LIS of x_1, \dots, x_n that ends in x_n

10/23/00

CS140(12)

12

Example

- 1, -3, 2, 10, 8, 23, -2, 17, 5

10/23/00

CS140(12)

13

To solve A

- Define B
- **Reduce A to B**
- Solve B using self-reduction

10/23/00

CS140(12)

14

LIS ∞ MLIS

10/23/00

CS140(12)

15

LIS ∞ MLIS

10/23/00

CS140(12)

16

To solve A

- Define B
- Reduce A to B
- **Solve B using self-reduction**

10/23/00

10/23/00

CS140(12)

18

MLIS Self-Reduction

10/23/00

CS140(12)

19

MLIS(x_1, \dots, x_n)

MLIS(x_1, \dots, x_n) =

1. LIS of x_1 that ends in x_1
2. LIS of x_1, x_2 that ends in x_2
- ⋮
- n-1. LIS of x_1, \dots, x_{n-1} that ends in x_{n-1}
- n. LIS of x_1, \dots, x_n that ends in x_n

10/23/00

CS140(12)

20

MLIS(x_1, \dots, x_n)

MLIS(x_1, \dots, x_n) = MLIS(x_1, \dots, x_{n-1})

1. LIS of x_1 that ends in x_1
2. LIS of x_1, x_2 that ends in x_2
- ⋮
- n-1. LIS of x_1, \dots, x_{n-1} that ends in x_{n-1}
- n. LIS of x_1, \dots, x_n that ends in x_n

10/23/00

CS140(12)

21

MLIS(x_1, \dots, x_n)

MLIS(x_1, \dots, x_n) =

1. LIS of x_1 that ends in x_1
2. LIS of x_1, x_2 that ends in x_2
- ⋮
- n-1. LIS of x_1, \dots, x_{n-1} that ends in x_{n-1}
- n. LIS of x_1, \dots, x_n that ends in x_n

How can we produce this?

10/23/00

CS140(12)

22

Construct MLIS(x_1, \dots, x_n)

MLIS(x_1, \dots, x_n) =

- 1) MLIS(x_1, \dots, x_{n-1}) plus
- 2) Choose longest LIS(x_1, \dots, x_j) ending in x_j ($j < n$) such that $x_j < x_n$. Append x_n .

10/23/00

CS140(12)

23

Recap: To solve A

- Define B
- Reduce A to B
- Solve B using self-reduction

10/23/00

CS140(12)

24

Grocery Bags

How should we pack n items weighing w_1, w_2, \dots, w_n ($w_i \leq W$) in two bags so as to minimize the difference in the weights of the bags?

Or even simpler: What is the smallest possible weight difference?

10/23/00

CS140(12)

25

Self-Reduction

I don't know how to make this work!

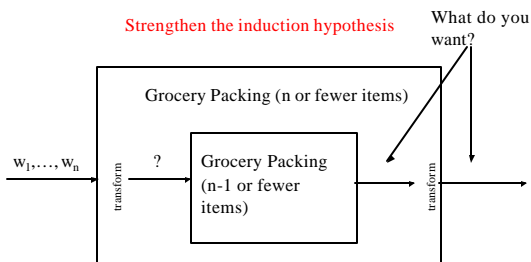

10/23/00

CS140(12)

26

Self-Reduction

Strengthen the induction hypothesis

10/23/00

CS140(12)

27

Problem B

- Input: Weights w_1, w_2, \dots, w_n
- Output: A binary vector T :
 $T[i] = 1$ if some subset of the weights sum to i
 $T[i] = 0$ otherwise
for $i=0, \dots, nW$

10/23/00

CS140(12)

28

Transform

t'_0	t'_1	t'_2	t'_3	...	$t'_{(n-1)W}$
--------	--------	--------	--------	-----	---------------

t_0	t_1	t_2	t_3	...	$t_{(n-1)W}$...	t_{nW}
-------	-------	-------	-------	-----	--------------	-----	----------

10/23/00

CS140(12)

29

Transform

t_0	t_1	t_2	t_3	...	t_i	...	t_{nW}
-------	-------	-------	-------	-----	-------	-----	----------

Set $t_i = 1$ if _____ or _____
Else $t_i = 0$

10/23/00

CS140(12)

30

Self-Reduction: Problem B

What are the base cases?

10/23/00 CS140(12) 31

Algorithm B

We'll use this later

```

// initialize
t[0]=1
for i=1,...,nW
    t[i]=0

// update
for i=1,...,n
    for j=W*i to w_i
        if t[j]=0 and t[j-w_i]=1 then t[j]=1
    
```

10/23/00 CS140(12) 32

Algorithm B

- Is it correct?
- Is it efficient?

10/23/00 CS140(12) 33

Reduction: $A \propto B$

10/23/00 CS140(12) 34

Algorithm A

Use Algorithm B to compute $t[0] \dots t[nW]$
 Let $S = \sum w_i$
 (Note: $t[0..S]$ is symmetric about $S/2$)
 Let j be the closest index to $S/2$ such that $t[j]=1$
 Return $|j - S/2|$

10/23/00 CS140(12) 35

Grocery Bags

What about this problem?

How should we pack n items weighing w_1, w_2, \dots, w_n ($w_i \leq W$) in two bags so as to minimize the difference in the weights of the bags?

Or even simpler: What is the smallest possible weight difference?

10/23/00 CS140(12) 36

Algorithm B: Pack Bags

```
// initialize
t[0]=1
for i=1,...,nW
  t[i]=0, b[i]=0

// update
for i=1,...,n
  for j=W*i to wi
    if t[j]=0 and t[j-wi]=1 then t[j]=1 & b[j]=i
```

10/23/00

CS140(12)

37

Algorithm A: Pack Bags

```
Cont. ... Let j be the closest index to S/2 such that t[j]=1
Bag 1 = Bag 2 = empty
While j>0
  Put item b[j] in Bag 1
  j -= b[j]
Put unpacked items in Bag 2
Return
```

10/23/00
