

Algorithm Design Techniques

- Induction
- Divide and Conquer
- Dynamic Programming
- Reduction
- **Greedy**
 - Kruskal's algorithm for MST

11/1/00

CS140(15)

Greedy Paradigm Get what you can NOW!

11/1/00

But sometimes it's better to look
around!

11/1/00

But sometimes it isn't ...

11/1/00

I hate gas stations!

- I'm driving cross country and my route is fixed.
- My map tells me exactly where every gas station along the route is located.
- I want to minimize the number of times I stop for gas...
- ... without running out!

11/1/00

CS140(15)

Greedy

- First stop
 - I'll stop at the farthest gas station I can get to without running out.
- Then repeat

11/1/00

CS140(15)

Greedy is Optimal!

- Can the optimal make a first stop that is later?

11/1/00

CS140(15)

Minimum Spanning Tree

- Input: Weighted graph G
- Output: Minimum weight spanning tree of G

11/1/00

CS140(15)

Weighted Graph

- $G=(V,E)$ is a connected, weighted graph with n vertices and m edges.

11/1/00

CS140(15)

Spanning Tree

- A spanning tree of G is a connected, acyclic subgraph with vertex set V .

11/1/00

CS140(15)

Weight of Spanning Tree

- The weight of spanning tree of G is the sum of the weights of its edges.

11/1/00

CS140(15)

Minimum Spanning Tree

- A minimum spanning tree of G is one with smallest possible weight.
- Find an MST of the following graph:

11/1/00

CS140(15)

Kruskal's (Greedy) Algorithm

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight.

$F=V$ (F is a forest of isolated vertices)

For $i=1$ to m

 If $F+\{e_i\}$ is acyclic then $F=F+\{e_i\}$.

Return(F)

11/1/00

CS140(15)

Kruskal's Algorithm

- Order the edge weights. (In this graph the weights are unique.)

MST of G with cost _____

11/1/00

CS140(15)

Kruskal's Algorithm

- Does it work in general?
- Prove it.

11/1/00

CS140(15)

Cut

- A **cut** is a partition of the vertices of G into two sets (R, B) .
- An edge e crosses the cut if it has an endpoint in each set of the cut.
- Which edges cross the (R, B) cut?

11/1/00

CS140(15)

Tree Facts

- A tree on n nodes has $n-1$ edges.

11/1/00

CS140(15)

Tree Facts

- If e is an edge of T then $T - \{e\}$ is a forest consisting of two trees.

11/1/00

CS140(15)

Tree Facts

- If e is an edge of G but not of T then $T + \{e\}$ contains exactly one cycle.

11/1/00

CS140(15)

Tree Facts

1. A tree on n nodes has $n-1$ edges.
2. If e is an edge of T then $T - \{e\}$ is a forest consisting of two trees.
3. If e is an edge of G but not of T then $T + \{e\}$ contains exactly one cycle.

11/1/00

CS140(15)

Kruskal's Algorithm Proof of Correctness

Claim:

At each stage of the algorithm F is a subgraph of some MST of G .

11/1/00

CS140(15)

Kruskal's Algorithm

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight.

$F=V$ (F is a forest of isolated vertices)

Claim is true here

For $i=1$ to m

If $F+\{e_i\}$ is acyclic then $F=F+\{e_i\}$.

Return(F)

11/1/00

CS140(15)

Loop Invariant

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight.

$F=V$ (F is a forest of isolated vertices) Claim is true here

If Claim is true here

For $i=1$ to m

If $F+\{e_i\}$ is acyclic then $F=F+\{e_i\}$.

Then Claim is true here

Return(F)

11/1/00

CS140(15)

Kruskal's Algorithm Proof of Correctness

Loop Invariant:

F is a subgraph of some MST of G .

Proof

Consider the k^{th} execution of the loop. Let T be a MST of G containing F . What can happen during the loop?

1. e_k is not added to F
2. e_k is added to F

11/1/00

CS140(15)

Kruskal's Algorithm Proof of Correctness

Loop Invariant:

F is a subgraph of some MST of G .

Proof

1. e_k is not added to F
In this case F does not change so the claim holds when execution of loop concludes

11/1/00

CS140(15)

Kruskal's Algorithm Proof of Correctness

Loop Invariant:

F is a subgraph of some MST of G .

Proof

2. e_k is added to F
We know that T is a MST of G and T contains F .
Need to show there is a MST of G that contains $F+\{e_k\}$
If e_k is an edge of T we are done. So assume not.

11/1/00

CS140(15)

What do we know?

Assume $e_k=(u,v)$. The vertices u and v are in separate connected components. Let S be the vertices of F_u .

11/1/00

CS140(15)

What do we know?

e_k is a minimum weight edge spanning $(S, V-S)$

11/1/00

CS140(15)

Using our tree facts

- The graph $T + \{e_k\}$ contains exactly one cycle.
- This cycle contains e_k and at least one additional edge e that spans $(S, V-S)$.
- $T + \{e_k\} - \{e\}$ is an MST of G .

11/1/00

CS140(15)

Moreover

- $T + \{e_k\} - \{e\}$ is an MST of G **that contains the edges of $F + \{e_k\}$.**

11/1/00

CS140(15)

Running Time

- We'll save that for later...

11/1/00

CS140(15)

Dijkstra's Algorithm

Number in node u indicate $d_G(s, u)$

11/1/00

CS140(15)

Prim's Algorithm (Another Greedy Algorithm)

Choose a vertex $w \in V$

$F = \{w\}$

While $V - F \neq \emptyset$

Let e be a minimum weight edge that emerges from F

$F = F + \{e\}$

11/1/00
