

Outline

- MST: Run Time analysis
 - Prim's
 - Kruskal's
- Single Source Shortest Path
 - Breadth-First Search
 - Dykstra's algorithm

11/06/00

CS140(16)

1

Prim's Algorithm

Choose a vertex $w \in V$

$F = \{w\}$

While $V - F \neq \emptyset$

Let e be a minimum weight edge that emerges from F

$F = F + \{e\}$

11/06/00

CS140(16)

2

Prim's example

11/06/00

CS140(16)

3

Prim's Algorithm Running Time: $O(n(?))$

Choose a vertex $w \in V$

$F = \{w\}$

While $V - F \neq \emptyset$

Let e be a minimum weight edge that emerges from F

$F = F + \{e\}$

How should we implement this?

11/06/00

CS140(16)

4

Consider naïve approach ...

- Go through edge list to find least weight edge emerging from F :

6,13,7,3,5,8,1,11,2,10,9,12,4

11/06/00

CS140(16)

5

Prim's Algorithm Running Time: $O(nm)$

Choose a vertex $w \in V$

$F = \{w\}$

While $V - F \neq \emptyset$

Let e be a minimum weight edge that emerges from F

$F = F + \{e\}$

Naïve approach $O(m)$

11/06/00

CS140(16)

6

What to do?

Data Structures

11/06/00

CS140(16)

7

Fringe vertex

v is a fringe vertex if it is in V-F and it is connected by an edge to a vertex u in F

11/06/00

CS140(16)

8

A less naïve approach ...

List of fringe vertices and for each its minimum weight edge to F

$[b,2], [d,3], [a,5],[c,10]$

11/06/00

CS140(16)

9

And even better...

- Keep the fringe vertices in a **HEAP!!!**

11/06/00

CS140(16)

10

Prim's Algorithm A Better Implementation

Choose a vertex $x \in V$

$F = \{x\}, H = \emptyset$

For each $e = (u,x)$: Add record $[u,e]$ to heap H keyed on $w(e)$

While $H \neq \emptyset$

$[u,e] = \text{Find-min}(H)$

Add u and e to F

For each edge incident to u : Update heap

11/06/00

CS140(16)

11

Update heap:

$[b,2],[d,3],[a,5],[c,10]$

- $[b,2]$: remove $[b,2]$ from heap $[d,3],[a,5],[c,10]$
- Add new fringe vertices: $[d,3],[a,5],[c,10],[e,12]$
- Update edge weights: $[d,3],[a,5],[c,9],[e,12]$

11/06/00

CS140(16)

12

Are these standard operations?

- Extract-min
- Add element to heap
- Reduce key of element in heap ?!?

11/06/00

CS140(16)

13

Decrease key

- Next homework assignment: Design decrease key algorithm for heaps that runs in time $O(\lg(n))$.

11/06/00

CS140(16)

14

Prim's Algorithm Running Time

Choose a vertex $x \in V$

$F = \{x\}$, $H = \emptyset$

For each $e = (u, x)$: **Insert**

While $H \neq \emptyset$

$[u, e] = \mathbf{Extract-min}(H)$

Add u and e to F

For each edge incident to u : **Insert or Decrease-key** or do nothing

11/06/00

CS140(16)

15

Prim's Algorithm Running Time

- Heap operations across algorithm:
 - n Extract-mins $O(\lg(n))$ each
 - n Inserts $O(\lg(n))$ each
 - $m - n$ Decrease-keys $O(\lg(n))$ each
 - m Do nothings $O(1)$ each
- Total time is $O(m \lg(n))$

11/06/00

CS140(16)

16

But wait ...suppose we could decrease-key in time $O(1)$

- Heap operations across algorithm:
 - n Extract-mins $O(\lg(n))$ each
 - n Inserts $O(\lg(n))$ each
 - $m - n$ Decrease-keys ~~$O(\lg(n))$~~ $O(1)$ each
 - m Do nothings $O(1)$ each
- Then total time is $O(m + n \lg(n))$

11/06/00

CS140(16)

17

Bravo, bravo ...

11/06/00

CS140(16)

18

Do It With Fibonacci Heaps

Huh?

Don't worry – it works!

11/06/00

CS140(16)

19

Kruskal's Algorithm

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight. $O(m \log m)$

$F = V$ $O(n)$

For $i=1$ to m

If $F + \{e_i\}$ is acyclic then $F = F + \{e_i\}$. $O(n)$

Return(F)

11/06/00

CS140(16)

20

Kruskal's Algorithm

- $O(m \log m + nm)$

11/06/00

CS140(16)

21

But Wait ...

Data Structures

11/06/00

CS140(16)

22

Union-Find Data Structure

- Disjoint-sets: S_1, S_2, \dots, S_k
- Operations:
 - MakeSet(x)
 - Union(x, y)
 - FindSet(x)

11/06/00

CS140(16)

23

Kruskal's Algorithm

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight. $O(m \log m)$

$F = V$: For each v in V MakeSet(v)

For $i=1$ to m

If $F + \{e_i\}$ is acyclic then $F = F + \{e_i\}$:

Assume $e_i = (u, v)$

If FindSet(u) \neq FindSet(v) then Union(u, v)

Return(F)

11/06/00

CS140(16)

24

Union-Find Data Structure

- Disjoint-sets: S_1, S_2, \dots, S_k
- Operations:
 - MakeSet(x) $O(1)$
 - Union(x,y)
 - FindSet(x)

11/06/00

CS140(16)

25

Running Time Analysis

- Prim's (and Dijkstra's)
 - Binary heap: $O(m \lg(n))$
 - Fibonacci heaps: $O(m+n \lg(n))$
- Kruskal's
 - DFS: $O(m \lg(m) + n^2)$
 - Union Find: $O(m \lg(m))$

11/06/00

CS140(16)

26

Single Source Shortest Path

- Input: Graph G with a designated start vertex s .
- Output: For each vertex v , the distance between s and v .

11/06/00

CS140(16)

27

Defs: Path Length, Distance

- In an unweighted graph
 - the length of a path is the number of edges in the path
 - the distance between two vertices is the length of a shortest path between the vertices
- We use $d_G(u,v)$ to denote the distance between u and v in G

11/06/00

CS140(16)

28

Example: Distance

$$d_G(s,s)=0, d_G(s,u)=1, d_G(s,v)=2$$

11/06/00

CS140(16)

29

Shortest path tree for s

A spanning tree of G such that the path between s and a vertex v in T is a shortest path in G .

Does such a tree always exist?

11/06/00

CS140(16)

30

Proof of Existence: Shortest path tree for s

- Order the vertices of G by distance from s :
 $v_0=s, v_1, v_2, \dots, v_n$
- Claim: There is a subtree T of G on vertices $\{v_0, \dots, v_i\}$ such that for every v_j , $d_T(s, v_j) = d_G(s, v_j)$.

11/06/00

CS140(16)

31

Base Case

- When $i=0$ the claim holds.

s ●

11/06/00

CS140(16)

32

Inductive Hypothesis

- There is a tree T such that $d_T(s, v) = d_G(s, v)$ for each v in $\{s=v_0, \dots, v_{i-1}\}$

11/06/00

CS140(16)

33

Now add v_i

- We need to exhibit T' such that $d_{T'}(s, v_k) = d_G(s, v_k)$ for each v in $\{s=v_0, \dots, v_{i-1}, v_i\}$.

11/06/00

CS140(16)

34

Observe

- Let s, \dots, u, v_i be a shortest path between s and v_i in G .
- Since $i > 0$, $u \neq v_i$.
- Thus $d_G(s, v_i) = 1 + d_G(s, u) > d_G(s, u)$.
- Therefore u precedes v_i in the ordering of vertices; i.e. $u = v_j$ for some $j < i$.

11/06/00

CS140(16)

35

Proof of Claim

- So u is already in T and, by our induction hypothesis, $d_G(s, u) = d_T(s, u)$.

11/06/00

CS140(16)

36

$$T' = T + (u, v_i)$$

- $d_{T'}(s, v_i) = 1 + d_T(s, u) = d_G(s, v_i)$

QED

11/06/00

CS140(16)

37

Shortest path tree for s

The path between s and v in T is a shortest path in G.

The edges traversed in Breadth-First(s) form shortest path tree for s.

49

Running Time

- The modified breadth-first algorithm for single source shortest path in an unweighted graph is: _____

11/06/00

CS140(16)

50

What if G is weighted?

11/06/00

CS140(16)

51

Single Source Shortest Path

- Input: Weighted graph G with a designated start vertex s . Weights are positive!
- Output: For each vertex v , the length of the **shortest path** between s and v .

11/06/00

CS140(16)

52

Path Length

- In a weighted graph the length of a path is the sum of the weights of the edges of the path.

11/06/00

CS140(16)

53

Shortest path tree for s

The path between s and v in T is a **shortest path** in G .

11/06/00

CS140(16)

54

Shortest path tree for s

- Is it clear such a tree exists? YES by same argument.

11/06/00 CS140(16) 55

Shortest path tree for s

- Claim: Let the vertices of G be sorted by distance from s. Then there is a subtree T of G on vertices $\{v_0, \dots, v_i\}$ such that $0 \leq k \leq i, d_T(s, v_k) = d_G(s, v_k)$ for each v in T.
- If you have a tree for $\{v_0, \dots, v_i\}$ can you find the tree for $\{v_0, \dots, v_i, v_{i+1}\}$?

11/06/00 CS140(16) 56

Shortest path tree for s

- Suppose you don't know the ordering?
- At each step find the vertex $v \notin T$ that minimizes $\min_{u \in T} d_T(s, u) + w(u, v)$.

11/06/00 CS140(16) 57
