Executable code—helloworld

Link with `libc.a` and `crt0.o`

- ▶ `crt0.o` contains startup code
- ▶ `libc.a` contains code for `write`
 - ▶ Note no dynamic/shared library support yet!
- ▶ Linker can resolve the relocation entries
- ▶ End result is an executable, or *load image*.

The OS still needs to:

- ▶ Decide if it has resources to run the program right now (long-term scheduler)
- ▶ Decide where to put the program in memory
- ▶ Perform any additional setup
- ▶ Start executing the program

Problems?

Confused programmers!

- Given a 32-bit address, it's hard to know which segment it points into

Are six segments enough?

Segmentation Architecture

2013-05-19 CS34
└─ Programs, Memory, & Address Space
 └─ Memory Sharing
 └─ Segmentation Architecture

Segmentation Architecture

Logical address consists of the pair
<segment-number, offset>

Example

- Use 32-bit logical address
 - High-order 8 bits are segment number
 - Low-order 24 bits are offset within segment
- 256 segments, of max size 16,777,216 bytes (16MB)

Logical address consists of the pair

<segment-number, offset>

Example

Use 32-bit logical address

- ▶ High-order 8 bits are segment number
- ▶ Low-order 24 bits are offset within segment

256 segments, of max size 16,777,216 bytes (16MB)

Segmentation Architecture—Segment Table

2013-05-19 CS34
└ Programs, Memory, & Address Space
 └ Memory Sharing
 └ Segmentation Architecture—Segment Table

Segmentation Architecture—Segment Table

Processor needs to map 2D user-defined addresses into 1D physical addresses.
In segment table, each entry has:

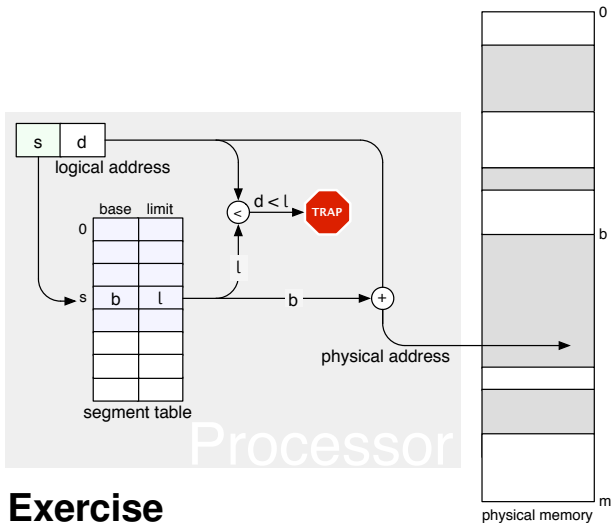

- *Base*—Starting address of the segment in physical memory
- *Limit*—Length of the segment

Processor needs to map 2D user-defined addresses into 1D physical addresses.

In *segment table*, each entry has:

- ▶ *Base*—Starting address of the segment in physical memory
- ▶ *Limit*—Length of the segment

Segment Table

 What are the practical limits on the number of segments?

Segmentation Architecture

Design Issues:

- ▶ Relocation
 - ▶ Dynamic
 - ▶ By segment table
- ▶ Sharing
 - ▶ Shared segments
 - ▶ Same segment number
- ▶ Allocation
 - ▶ First fit/best fit
 - ▶ External fragmentation

Class Exercise

Do shared segments *need* to have the same segment number?

- ▶ If so, why?
- ▶ If not, why? (And why might we give them the same segment number anyway?)

Segmentation Architecture

Design Issues:

- ▶ Relocation
 - Dynamic
 - By segment table
- ▶ Sharing
 - Shared segments
 - Same segment number
- ▶ Allocation
 - First fit/best fit
 - External fragmentation

Class Exercise

Do shared segments need to have the same segment number?

- If so, why?
- If not, why? (And why might we give them the same segment number anyway?)

Segmentation Architecture

Class Exercise

Does our segmentation scheme capture the *difference* between code and data segments?

- ▶ If not, what would we need to fix it?

Class Exercise

What if a program wants more contiguous data space than a segment can hold? Is this a problem?

2013-05-19

Segmentation Architecture

Class Exercise

Does our segmentation scheme capture the difference between code and data segments?

▶ If not, what would we need to fix it?

Class Exercise

What if a program wants more contiguous data space than a segment can hold? Is this a problem?

With each entry in segment table, associate:

- Validation bit—0 => illegal segment
- Read/write/execute privileges
- Protection bits associated with segments; code sharing occurs at segment level

What kinds of fragmentation do we have?

- ▶ Internal—Not a problem
- ▶ External—We have a problem! (And compaction would take too long)

What's the cause of the fragmentation?

- ▶ Differing segment sizes

Segmentation Architecture—Fragmentation

Class Exercise

What kinds of fragmentation do we have?

- ▶ Internal—Not a problem
- ▶ External—We have a problem! (And compaction would take too long)

What's the cause of the fragmentation?

- ▶ Differing segment sizes

Crazy Solution !?!

Make all segments the same size!

- ▶ But now we have internal fragmentation!
- ▶ Better make the segments small, to minimize wastage—remember, we can cope with small segments

Tiny Segments

2013-05-19 CS34
└ Programs, Memory, & Address Space
 └ Memory Sharing
 └ Paging

Tiny Segments

Properties

- All segments are the same size (e.g., 4K)
- No need for limit registers
- No longer reflect program structure

Properties

- ▶ All segments are the same size (e.g., 4K)
- ▶ No need for limit registers
- ▶ No longer reflect program structure

Paging

2013-05-19 CS34
└ Programs, Memory, & Address Space
 └ Memory Sharing
 └ Paging

Paging

Properties

- All pages are the same size (e.g., 4K)
- No need for limit registers
- No longer reflect program structure
- Physical locations for pages are called **page frames**

Properties

- ▶ All pages are the same size (e.g., 4K)
- ▶ No need for limit registers
- ▶ No longer reflect program structure
- ▶ Physical locations for pages are called **page frames**
