Ratio Games

- Choosing a base system
- Using ratio metrics
- Relative performance enhancement
- Ratio games with percentages
- Strategies for winning a ratio game
- Correct analysis of ratios

Choosing a Base System

- ▶ Run workloads on two systems
- ▶ Normalize performance to chosen system
- ▶ Take average of ratios
- ▶ *Presto*: you control what's best

2015-06-15 CS147
└ Ratio Games
└ How to Lie
└ Choosing a Base System

Choosing a Base System

- Run workloads on two systems
- Normalize performance to chosen system
- Take average of ratios
- *Presto*: you control what's best

Example of Choosing a Base System

- (Carefully) selected Ficus results:

	1	2	1/2	2/1
cp	231.8	168.6	1.37	0.73
r _{cp}	260.6	338.3	0.77	1.30
Mean	246.2	253.45	1.07	1.02

2015-06-15

CS147

└ Ratio Games

└ How to Lie

└ Example of Choosing a Base System

Example of Choosing a Base System

► (Carefully) selected Ficus results:

	1	2	1/2	2/1
cp	231.8	168.6	1.37	0.73
r _{cp}	260.6	338.3	0.77	1.30
Mean	246.2	253.45	1.07	1.02

Here, the mean running time on two replicas is worse. But by choosing the appropriate base, I can make a single replica 7% slower, or I can make two replicas 2% slower (i.e., a single replica is 2% faster).

Why Does This Work?

- ▶ Expand the arithmetic:

$$R_{a;b} = \frac{y_a}{y_b} \quad R_{b;b} = 1.0$$

$$P_{a;b} = \frac{1}{n} \sum R_{i;a;b} = \frac{1}{n} \left(\frac{y_{0;a}}{y_{0;b}} + \frac{y_{1;a}}{y_{1;b}} + \dots \right)$$

$$\neq \frac{\frac{1}{n} \sum y_{i;a}}{\frac{1}{n} \sum y_{i;b}} \neq \frac{1}{P_{b;a}}$$

2015-06-15

CS147

└ Ratio Games

└ How to Lie

└ Why Does This Work?

Why Does This Work?

• Expand the arithmetic:

$$R_{a;b} = \frac{y_a}{y_b} \quad R_{b;b} = 1.0$$

$$P_{a;b} = \frac{1}{n} \sum R_{i;a;b} = \frac{1}{n} \left(\frac{y_{0;a}}{y_{0;b}} + \frac{y_{1;a}}{y_{1;b}} + \dots \right)$$

$$\neq \frac{\frac{1}{n} \sum y_{i;a}}{\frac{1}{n} \sum y_{i;b}} \neq \frac{1}{P_{b;a}}$$

R is the performance ratio of the overall test, i.e., the total time of all tests (equivalently, their average, assuming paired tests). P is the average of ratios.

Using Ratio Metrics

- ▶ Pick a metric that is itself a ratio
 - ▶ E.g., power = throughput \div response time
 - ▶ Or cost/performance
- ▶ Handy because division is “hidden”

2015-06-15 CS147
└ Ratio Games
└ How to Lie
└ Using Ratio Metrics

Using Ratio Metrics

- Pick a metric that is itself a ratio
 - E.g., power = throughput \div response time
 - Or cost/performance
- Handy because division is “hidden”

This is subtler because of the hidden division.

Relative Performance Enhancement

- ▶ Compare systems with incomparable bases
- ▶ Turn into ratios
- ▶ Example: compare Ficus 1 vs. 2 replicas with UFS vs. NFS (1 run on chosen day):

	"cp" Time		Ratio
Ficus 1 vs. 2	197.4	246.6	1.25
UFS vs. NFS	178.7	238.3	1.33

- ▶ "Proves" adding Ficus replica costs less than going from UFS to NFS

2015-06-15

CS147

└ Ratio Games

└ How to Lie

└ Relative Performance Enhancement

Relative Performance Enhancement

- Compare systems with incomparable bases
- Turn into ratios
- Example: compare Ficus 1 vs. 2 replicas with UFS vs. NFS (1 run on chosen day):

	"cp" Time		Ratio
Ficus 1 vs. 2	197.4	246.6	1.25
UFS vs. NFS	178.7	238.3	1.33

- "Proves" adding Ficus replica costs less than going from UFS to NFS

Ratio Games with Percentages

- ▶ Percentages are inherently ratios
 - ▶ But disguised
 - ▶ So great for ratio games
- ▶ Example: Passing tests

Test	A Runs	A Passes	A %	B Runs	B Passes	B %
1	300	60	20	32	8	25
2	50	2	4	500	40	8
Total	350	62	18	532	48	9

- ▶ A is worse, but looks better in total line!

2015-06-15

CS147

└ Ratio Games

└ How to Lie

└ Ratio Games with Percentages

Ratio Games with Percentages

- Percentages are inherently ratios
 - But disguised
 - So great for ratio games
- Example: Passing tests

Test	A Runs	A Passes	A %	B Runs	B Passes	B %
1	300	60	20	32	8	25
2	50	2	4	500	40	8
Total	350	62	18	532	48	9

- A is worse, but looks better in total line!

More on Percentages

- ▶ Psychological impact
 - ▶ 1000% sounds bigger than 10-fold (or 11-fold)
 - ▶ Great when both original and final performance are lousy
 - ▶ E.g., salary went from \$40 to \$80 per week
- ▶ Small sample sizes can generate big lies
 - ▶ “83% of dentists surveyed recommend Crest”
 - ▶ (We asked 6 dentists; 5 liked Crest)
- ▶ Base should be initial, not final value
 - ▶ E.g., price can't drop 400%

2015-06-15

CS147

Common Mistakes in Experimentation

- Ignoring experimental error
- Uncontrolled parameters
- Not isolating effects of different factors
- One-factor-at-a-time experimental designs
- Interactions ignored
- **Designs require too many experiments**

Types of Experimental Designs

- ▶ Simple designs
- ▶ Full factorial design
- ▶ Fractional factorial design

2015-06-15 CS147
└ Experimental Design
└ Introduction
└ Types of Experimental Designs

Types of Experimental Designs

- Simple designs
- Full factorial design
- Fractional factorial design

This is all we'll cover, but there are other possibilities.

Simple Designs

- ▶ Vary one factor at a time
- ▶ For k factors with i^{th} factor having n_i levels, number of experiments needed is:

$$n = 1 + \sum_{i=1}^k (n_i - 1)$$

- ▶ Assumes factors don't interact
 - ▶ Even then, more effort than required
- ▶ Don't use it, usually

2015-06-15

CS147

- └ Experimental Design
 - └ Introduction
 - └ Simple Designs

Simple Designs

- Vary one factor at a time
- For k factors with i^{th} factor having n_i levels, number of experiments needed is:

$$n = 1 + \sum_{i=1}^k (n_i - 1)$$

- Assumes factors don't interact
 - Even then, more effort than required
- Don't use it, usually

Full Factorial Designs

- ▶ Test every possible combination of factors' levels
- ▶ For k factors with i^{th} factor having n_i levels:

$$n = \prod_{i=1}^k n_i$$

- ▶ Captures full information about interaction
- ▶ But a huge amount of work

- Test every possible combination of factors' levels
- For k factors with i^{th} factor having n_i levels:

$$n = \prod_{i=1}^k n_i$$

- Captures full information about interaction
- But a huge amount of work

Reducing the Work in Full Factorial Designs

- ▶ Reduce number of levels per factor
 - ▶ Generally good choice
 - ▶ Especially if you know which factors are most important
 - ▶ Use more levels for those
- ▶ Reduce number of factors
 - ▶ But don't drop important ones!
- ▶ Use fractional factorial designs

2015-06-15

CS147

└ Experimental Design

Reducing the Work in Full Factorial Designs

- Reduce number of levels per factor
 - Generally good choice
 - Especially if you know which factors are most important
 - Use more levels for those
- Reduce number of factors
 - But don't drop important ones!
- Use fractional factorial designs

Fractional Factorial Designs

- ▶ Only measure some combination of levels of the factors
- ▶ Must design carefully to best capture any possible interactions
- ▶ Less work, but more chance of inaccuracy
- ▶ Especially useful if some factors are known to not interact
- ▶ Covered later

2015-06-15

Allocation of Variation for 2² Model

- ▶ Calculate the sample variance of y:

$$s_y^2 = \frac{\sum_{i=1}^{2^2} (y_i - \bar{y})^2}{2^2 - 1}$$

- ▶ Numerator is SST: total variation

$$\text{SST} = 2^2 q_A^2 + 2^2 q_B^2 + 2^2 q_{AB}^2$$

- ▶ SST explains causes of variation in y

2015-06-15

CS147

└ Experimental Design

└ 2^k Designs└ Allocation of Variation for 2² ModelAllocation of Variation for 2² Model

- Calculate the sample variance of y:

$$s_y^2 = \frac{\sum_{i=1}^{2^k} (y_i - \bar{y})^2}{2^k - 1}$$

- Numerator is SST: total variation

$$\text{SST} = 2^2 q_A^2 + 2^2 q_B^2 + 2^2 q_{AB}^2$$

- SST explains causes of variation in y

Derivation of SST is in book, pp. 287–288. Note that q_0 is exactly the sample mean \bar{y} . Thus, $y_i - \bar{y} = q_A x_{Ai} + q_B x_{Bi} + q_{AB} x_{Ai} x_{Bi}$. Squaring the latter gives the squares of the individual terms, plus product terms—but the product terms sum to zero because the columns in the sign matrix are orthogonal.

Terms in the SST

- ▶ $2^2 q_A^2$ is variation explained by effect of A: SSA
- ▶ $2^2 q_B^2$ is variation explained by effect of B: SSB
- ▶ $2^2 q_{AB}^2$ is variation explained by interaction between A and B: SSAB
- ▶ SST = SSA + SSB + SSAB
- ▶ In each case, divide SSx by SST to get percent of variation explained by that factor
 - ▶ Useful for deciding which factors are important

2015-06-15

- CS147
 - └ Experimental Design
 - └ 2^k Designs
 - └ Terms in the SST

Terms in the SST

- $2^2 q_A^2$ is variation explained by effect of A: SSA
- $2^2 q_B^2$ is variation explained by effect of B: SSB
- $2^2 q_{AB}^2$ is variation explained by interaction between A and B: SSAB
- SST = SSA + SSB + SSAB
- In each case, divide SSx by SST to get percent of variation explained by that factor
 - Useful for deciding which factors are important

Note that *variation* is not *variance*; computing contribution of each factor to variance is hard.

Variations in Our Example

- ▶ SST = 350449
- ▶ SSA = 349281
- ▶ SSB = 1024
- ▶ SSAB = 144
- ▶ Now easy to calculate fraction of total variation caused by each effect:
 - ▶ Fraction explained by A is 99.67%
 - ▶ Fraction explained by B is 0.29%
 - ▶ Fraction explained by interaction of A and B is 0.04%
- ▶ So almost all variation comes from number of nodes
- ▶ If you want to run faster, apply more nodes, don't turn on dynamic load management

2015-06-15 CS147
└ Experimental Design
└ 2^k Designs
└ Variations in Our Example

Variations in Our Example

- SST = 350449
- SSA = 349281
- SSB = 1024
- SSAB = 144
- Now easy to calculate fraction of total variation caused by each effect:
 - Fraction explained by A is 99.67%
 - Fraction explained by B is 0.29%
 - Fraction explained by interaction of A and B is 0.04%
- So almost all variation comes from number of nodes
- If you want to run faster, apply more nodes, don't turn on dynamic load management

In this simple example, the same conclusion could have been drawn simply by observing the numbers. But that's not always the case.

General 2^k Factorial Designs

- ▶ Used to explain effects of k factors, each with two alternatives or levels
- ▶ 2² factorial designs are a special case
- ▶ Same methods extend to more general case
- ▶ Many more interactions between pairs (and trios, etc.) of factors

2015-06-15

• Sign table columns A, B, C are binary count; interactions are products of appropriate columns:

y	I	A	B	C	AB	AC	BC	ABC
14	1	-1	-1	-1	1	1	1	-1
22	1	1	-1	-1	-1	-1	1	1
10	1	-1	1	-1	-1	1	-1	1
34	1	1	1	-1	1	-1	-1	-1
46	1	-1	-1	1	1	-1	-1	1
58	1	1	-1	1	-1	1	-1	-1
50	1	-1	1	1	-1	-1	1	-1
86	1	1	1	1	1	1	1	1
T/8	40	10	5	20	5	2	3	1
