

Algorithm Design Techniques

- Induction (or Self-Reduction)
- Reduction
- Divide and Conquer (special case of Self-Reduction)
- **Greedy**

3/8/01

CS140 Lec 11

Greedy Paradigm Get what you can NOW!

3/8/01

But sometimes it's better to look
around!

3/8/01

But sometimes it isn't ...

3/8/01

I hate gas stations!

- I'm driving cross country and my route is fixed.
- My map tells me exactly where every gas station along the route is located.
- I want to minimize the number of times I stop for gas...
- ... without running out!

3/8/01

CS140 Lec 11

Greedy

- First stop
 - I'll stop at the farthest gas station I can get to without running out.
- Then repeat

3/8/01

CS140 Lec 11

Greedy is Optimal!

- Can the optimal make a first stop that is later?

3/8/01

CS140 Lec 11

Minimum Spanning Tree

- Input: Weighted graph G
- Output: Minimum weight spanning tree of G

3/8/01

CS140 Lec 11

Weighted Graph

- $G=(V,E)$ is a connected, weighted graph with n vertices and m edges.

3/8/01

CS140 Lec 11

Spanning Tree

- A spanning tree of G is a connected, acyclic subgraph with vertex set V .

3/8/01

CS140 Lec 11

Weight of Spanning Tree

- The weight of spanning tree of G is the sum of the weights of its edges.

3/8/01

CS140 Lec 11

Minimum Spanning Tree

- A minimum spanning tree of G is one with smallest possible weight.
- Find an MST of the following graph:

3/8/01

CS140 Lec 11

Prim's Algorithm

Choose a vertex $w \in V$

$F = \{w\}$

While $V - F \neq \emptyset$

Let e be a minimum weight edge that
emerges from F

$F = F + \{e\}$

3/8/01

3/8/01

CS140 Lec 11

Prim's Algorithm

- Is it correct?
- Is it efficient?

3/8/01

CS140 Lec 11

Cut

- A **cut** is a partition of the vertices of G into two sets (R, B) .
- An edge e crosses the cut if it has an endpoint in each set of the cut.
- Which edges cross the (R, B) cut?

3/8/01

CS140 Lec 11

Cut Theorem

- Let (R, B) be a cut of graph G and let e be a minimum weight edge crossing the cut.
- Then e is in some minimum spanning tree of T .
- If e is the least weight edge spanning the cut then it is in every minimum spanning tree of T .

3/8/01

CS140 Lec 11

Tree Facts

- A tree on n nodes has $n-1$ edges.

3/8/01

CS140 Lec 11

Tree Facts

- If e is an edge of T then $T-\{e\}$ is a forest consisting of two trees.

3/8/01

CS140 Lec 11

Tree Facts

- If e is an edge of G but not of T then $T+\{e\}$ contains exactly one cycle.

3/8/01

CS140 Lec 11

Tree Facts

1. A tree on n nodes has $n-1$ edges.
2. If e is an edge of T then $T-\{e\}$ is a forest consisting of two trees.
3. If e is an edge of G but not of T then $T+\{e\}$ contains exactly one cycle.

3/8/01

CS140 Lec 11

Proof: Cut Theorem

- Let (R,B) be a cut of graph G and let e be a minimum weight edge crossing the cut.
- Let T be a minimum spanning tree of G .
- If e is in T we are done so suppose not.
- Consider the graph $T+\{e\}$.

3/8/01

CS140 Lec 11

Proof: Cut Theorem

- Consider the graph $T+\{e\}$.
 - By our tree facts this graph has exactly one cycle and the cycle includes e .
 - Removing any edge of the cycle yields a spanning tree of G .
 - If the cycle contains an edge e' such that $w(e') \geq w(e)$ then $T+\{e\}-\{e'\}$ is a spanning tree with weight no more than T .

3/8/01

CS140 Lec 11

Consider the cut (R,B)

- Since e spans the cut at least one other edge of the cycle must also span the cut.
- Why?
- So what?

3/8/01 CS140 Lec 11

Prim's Algorithm

- Is it correct?
 - If the edge weights are unique then it follows immediately from the cut theorem.
 - What if the edge weights are not unique?
- Is it efficient?

3/8/01 CS140 Lec 11

Prim's Algorithm

Choose a vertex $w \in V$
 $F = \{w\}$
 While $V - F \neq \emptyset$
 Let e be a minimum weight edge that emerges from F
 $F = F + \{e\}$

3/8/01 CS140 Lec 11

Prim's Algorithm

Running Time: $O(n(?))$

Choose a vertex $w \in V$
 $F = \{w\}$
 While $V - F \neq \emptyset$
 Let e be a minimum weight edge that emerges from F
 $F = F + \{e\}$

How should we implement this?

3/8/01 CS140 Lec 11

Consider naïve approach ...

- Go through edge list to find least weight edge emerging from F :
 6,13,7,3,5,8,1,11,2,10,9,12,4

3/8/01 CS140 Lec 11

Prim's Algorithm

Running Time: $O(nm)$

Choose a vertex $w \in V$
 $F = \{w\}$
 While $V - F \neq \emptyset$
 Let e be a minimum weight edge that emerges from F
 $F = F + \{e\}$

Naïve approach $O(m)$

3/8/01 CS140 Lec 11

What to do?

3/8/01

CS140 Lec 11

Fringe vertex

v is a fringe vertex if it is in V-F and it is connected by an edge to a vertex u in F

3/8/01

CS140 Lec 11

A less naïve approach ...

List of fringe vertices and for each its minimum weight edge to F

$[b,2], [d,3], [a,5], [c,10]$

3/8/01

CS140 Lec 11

And even better...

- Keep the fringe vertices in a **HEAP!!!**

3/8/01

CS140 Lec 11

Prim's Algorithm A Better Implementation

Choose a vertex $x \in V$

$F = \{x\}, H = \emptyset$

For each $e = (u, x)$: Add record $[u, e]$ to heap H keyed on $w(e)$

While $H \neq \emptyset$

$[u, e] = \text{Find-min}(H)$

Add u and e to F

For each edge incident to u : Update heap

3/8/01

CS140 Lec 11

Update heap: $[b,2], [d,3], [a,5], [c,10]$

- $[b,2]$: remove $[b,2]$ from heap $[d,3], [a,5], [c,10]$
- Add new fringe vertices: $[d,3], [a,5], [c,10], [e,12]$
- Update edge weights: $[d,3], [a,5], [c,9], [e,12]$

3/8/01

CS140 Lec 11

Are these standard operations?

- Extract-min
- Add element to heap
- Reduce key of element in heap ?!?

3/8/01

CS140 Lec 11

Decrease key

- Next homework assignment: Design decrease key algorithm for heaps that runs in time $O(\lg(n))$.

3/8/01

CS140 Lec 11

Prim's Algorithm Running Time

Choose a vertex $x \in V$

$F = \{x\}$, $H = \emptyset$

For each $e = (u, x)$: **Insert**

While $H \neq \emptyset$

$[u, e] = \mathbf{Extract-min}(H)$

Add u and e to F

For each edge incident to u : **Insert or Decrease-key** or do nothing

3/8/01

CS140 Lec 11

Prim's Algorithm Running Time

- Heap operations across algorithm:
 - n Extract-mins $O(\lg(n))$ each
 - n Inserts $O(\lg(n))$ each
 - $m - n$ Decrease-keys $O(\lg(n))$ each
 - m Do nothings $O(1)$ each
- Total time is $O(m \lg(n))$

3/8/01

CS140 Lec 11

But wait ...suppose we could decrease-key in time $O(1)$

- Heap operations across algorithm:
 - n Extract-mins $O(\lg(n))$ each
 - n Inserts $O(\lg(n))$ each
 - $m - n$ Decrease-keys ~~$O(\lg(n))$~~ $O(1)$ each
 - m Do nothings $O(1)$ each
- Then total time is $O(m + n \lg(n))$

3/8/01

CS140 Lec 11

Bravo, bravo ...

3/8/01

CS140 Lec 11

Do It With Fibonacci Heaps

Huh?

Don't worry – it works!

3/8/01

CS140 Lec 11

Kruskal's (Greedy) Algorithm

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight.

$F = V$ (F is a forest of isolated vertices)

For $i = 1$ to m

If $F + \{e_i\}$ is acyclic then $F = F + \{e_i\}$.

Return(F)

MST of G with cost _____

3/8/01

CS140 Lec 11

Kruskal's Algorithm

- Does it work in general?
- Prove it.

3/8/01

CS140 Lec 11

Kruskal's Algorithm Proof of Correctness

Claim:

At each stage of the algorithm F is a subgraph of some MST of G .

3/8/01

CS140 Lec 11

Kruskal's Algorithm

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight.

$F = V$ (F is a forest of isolated vertices)

Claim is true here

For $i=1$ to m

If $F + \{e_i\}$ is acyclic then $F = F + \{e_i\}$.

Return(F)

3/8/01

CS140 Lec 11

Loop Invariant

Let e_1, e_2, \dots, e_m be the edges of G sorted by increasing weight.

$F = V$ (F is a forest of isolated vertices) Claim is true here

If Claim is true here

For $i=1$ to m

If $F + \{e_i\}$ is acyclic then $F = F + \{e_i\}$.

Then Claim is true here

Return(F)

3/8/01

CS140 Lec 11

Kruskal's Algorithm Proof of Correctness

Loop Invariant:

F is a subgraph of some MST of G .

Proof

Consider the k^{th} execution of the loop. Let T be a MST of G containing F . What can happen during the loop?

1. e_k is not added to F
2. e_k is added to F

3/8/01

CS140 Lec 11

Kruskal's Algorithm Proof of Correctness

Loop Invariant:

F is a subgraph of some MST of G .

Proof

1. e_k is not added to F
In this case F does not change so the claim holds when execution of loop concludes

3/8/01

CS140 Lec 11

Kruskal's Algorithm Proof of Correctness

Loop Invariant:

F is a subgraph of some MST of G.

Proof

- e_k is added to F
We know that T is a MST of G and T contains F.
Need to show there is a MST of G that contains $F + \{e_k\}$
If e_k is an edge of T we are done. So assume not.

3/8/01

CS140 Lec 11

What do we know?

Assume $e_k = (u, v)$. The vertices u and v are in separate connected components. Let S be the vertices of F_u .

3/8/01

CS140 Lec 11

What do we know?

e_k is a minimum weight edge spanning $(S, V-S)$

3/8/01

CS140 Lec 11

Using our tree facts

- The graph $T + \{e_k\}$ contains exactly one cycle.
- This cycle contains e_k and at least one additional edge e that spans $(S, V-S)$.
- $T + \{e_k\} - \{e\}$ is an MST of G.

3/8/01

CS140 Lec 11

Moreover

- $T + \{e_k\} - \{e\}$ is an MST of G **that contains the edges of $F + \{e_k\}$.**

3/8/01

CS140 Lec 11

Running Time

- We'll save that for later...

3/8/01

CS140 Lec 11
