CS140 - Lec 5

1

Today

- Lower bounds
 - **Counting arguments**
 - Ad hoc arguments
 - Adversary arguments

9/26/01

CS140 - Lec 5

2

Run Time Bounds

Worst Case running times of classic sorting algorithms:

- Bubble-sort: $\Theta(n^2)$
- Insertion-sort: $\Theta(n^2)$
- Merge-sort $\Theta(n \log(n))$
- Heap-sort $\Theta(n \log(n))$
- Quick-sort $\Theta(n^2)$

9/26/01

CS140 - Lec 5

3

Comparison-based sorting

A comparison-based sorting algorithm is one that doesn't need to read the input, provided it is given the size of the input and a comparison oracle.

9/26/01

CS140 - Lec 5

4

Lower Bound for Sorting

Theorem: Any comparison-based sorting algorithms has a worst-case running time that is $\Omega(n \log(n))$.

9/26/01

CS140 - Lec 5

5

Proof of Theorem

A decision tree describes the queries of a comparison-based algorithm on input size n .

A root to leaf path represents the sequence of queries for a particular input.

9/26/01

CS140 - Lec 5

6

Proof of Theorem cont.

Each leaf corresponds to the permutation that sorts the input.

9/26/01

CS140 - Lec 5

7

Proof cont.

- There must be at least $n!$ leaves.
- A binary tree with $n!$ leaves has a path with length at least $\log(n!)$.
- By Stirling's approximation $\log(n!) = \Omega(n \log(n))$.

9/26/01

CS140 - Lec 5

Today

- Lower bounds
 - Counting arguments
 - **Ad hoc arguments**
 - Adversary arguments

9/26/01

CS140 - Lec 5

9

FIND-MIN

- How many comparisons does it take to find the minimum in a set of integers?
- Answer: $n-1$

9/26/01

CS140 - Lec 5

10

FIND-MIN

- How many comparisons does it take to find the minimum in a set of integers? In worst case
- Answer: $n-1$

9/26/01

CS140 - Lec 5

11

Upper Bound for FIND-MIN

Upper Bound Theorem: Finding the minimum in a set of n integers requires no more than $n-1$ comparisons.

Proof: Give algorithm

9/26/01

CS140 - Lec 5

12

Lower Bound for FIND-MIN

Lower Bound Theorem: Finding the minimum in a set of integers requires at least $n-1$ comparisons.

9/26/01

CS140 - Lec 5

13

Proof of Lower Bound:

- Consider an algorithm **A** on input of size n .
- Let G be a graph with a vertex for each input integer. Initially G has no edges. When **A** compares two input values, we'll add an edge between the corresponding vertices of G .
- **A** cannot conclude until G has _____ edges.
- Thus **A** cannot conclude until it has made _____ comparisons.

9/26/01

CS140 - Lec 5

14

Today

- Lower bounds
 - Counting arguments
 - Ad hoc arguments
 - **Adversary arguments**

9/26/01

CS140 - Lec 5

15

Upper Bound for FIND-MIN/MAX

- Upper Bound Theorem: Finding the minimum and maximum in a set of n integers requires no more than $\lceil 3n/2 \rceil - 2$ comparisons.
- Proof: Give an algorithm

9/26/01

CS140 - Lec 5

16

Proof of Upper Bound:

- Algorithm for even n :
 - Make $n/2$ pair-wise comparisons
 - Find the maximum of the winners with $n/2-1$ comparisons
 - Find the minimum of the losers with $n/2-1$ comparisons
- Algorithm for odd n :
 - Run even algorithm on first $n-1$ integers
 - Compare the min and max to the last integer

9/26/01

CS140 - Lec 5

17

Lower Bound for FIND-MIN/MAX

- Lower Bound Theorem: Finding the minimum and maximum in a set of n integers requires at least $\lceil 3n/2 \rceil - 2$ comparisons.
- Proof: Adversary argument

9/26/01

CS140 - Lec 5

18

Example of an adversary

You pick a number y between 1 and 100
 I have to guess y by posing queries of the form
 "Is it x ?"
 You answer "yes, $x=y$ " or "no, $y < x$ " or "no, $y > x$ "

- How many queries can you force me to make?
- Prove it!

Adversary Argument to prove bound B (for FIND MIN/MAX)

FIND-MIN/MAX Adversary - Accounting

- Adversary = interactive comparison oracle
- Accounting scheme: For x in S

$b_{MAX}(x) =$

- 1 if the algorithm can rule out x as the largest integer
- 0 otherwise

$b_{MIN}(x) =$

- 1 if the algorithm can rule out x as the smallest integer
- 0 otherwise

FIND-MIN/MAX Adversary- Strategy

- On query "Is $x < y$?"
- Answer consistently with previous answers
- If yes and no both consistent then answer so as to minimize the changes in b_{MAX} and b_{MIN} variables

FIND-MIN/MAX Adversary - Analysis

Consider a query "Is $x < y$?"

- If NO: $b_{MIN}(x) \rightarrow 1$ and $b_{MAX}(y) \rightarrow 1$
- If YES: $b_{MAX}(x) \rightarrow 1$ and $b_{MIN}(y) \rightarrow 1$

Proof of Lower Bound:

- Claim: At most $\lfloor n/2 \rfloor$ queries can result in the change of two $b_{MIN/MAX}$ variables
- Claim: $2n-2$ changes must occur before the algorithm concludes

$\Rightarrow \lfloor n/2 \rfloor + (2n-2) - 2\lfloor n/2 \rfloor$ queries are necessary

Find-gap

- Input: $S: x_1, x_2, \dots, x_n$ is a list of distinct integers sorted in ascending order.
- Question: Is there an index i such that $x_i + 1 < x_{i+1}$?
- How many elements of S have to be read (in worst case) in order to answer?

9/26/01

CS140 - Lec 5

25

Exercise

- What is a good adversary strategy?
- What is a good algorithm strategy?

9/26/01

CS140 - Lec 5

26

Double 0's

- Input: $B: b_1, \dots, b_n$ n -bit vector of 0/1's
- Question: Are there two adjacent 0's?
- How many bits of B have to be read (in worst case) in order to answer?

9/26/01

CS140 - Lec 5

27

Exercise

- What is a good adversary strategy?
- What is a good algorithm strategy?

9/26/01

CS140 - Lec 5

28

Upper Bound

Claim: Double 0's can be solved with $f(n)$ queries where:
 $f(n) = n-1$ if $n \equiv 1 \pmod 3$
 $= n$ otherwise

9/26/01

CS140 - Lec 5

29

Lower Bound

Double 0's cannot be solved with fewer than $g(n)$ queries where:
 $G(n) = n-1$ if $n \equiv 1 \pmod 3$
 $= n$ otherwise

9/26/01

CS140 - Lec 5
