

# Regular Languages

CS 81: Computability and Logic

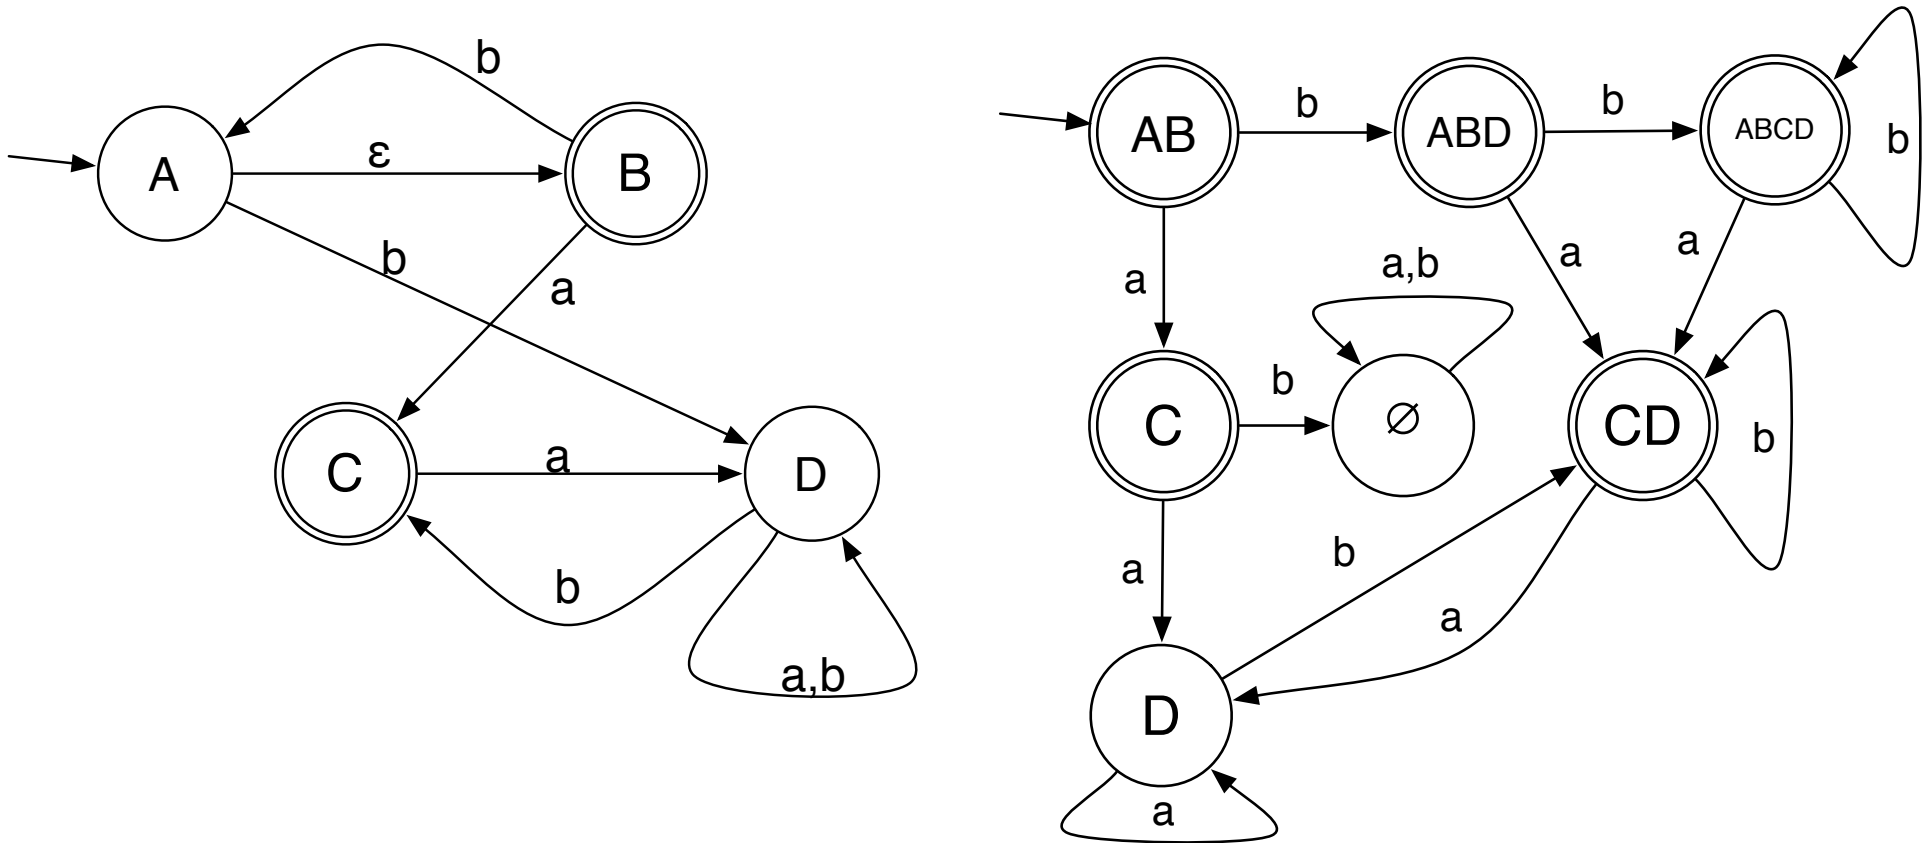

October 21, 2010

# Representing Regular Languages: The Story So Far

# Components of a State Machine?

# From NFA to DFA: the **Subset Construction**

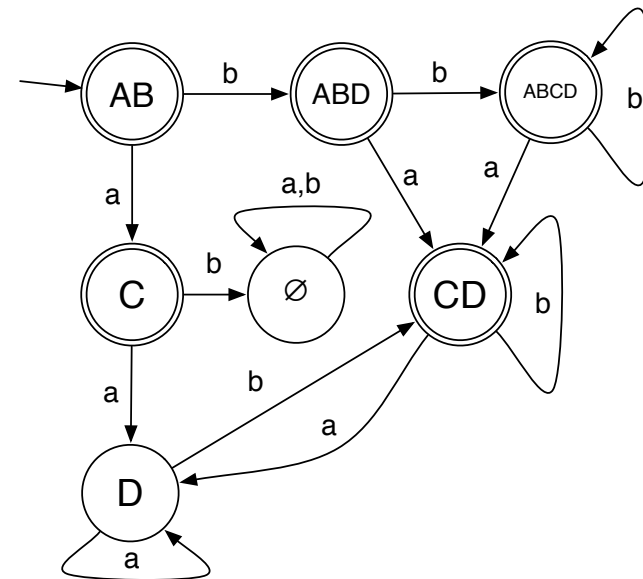

# The Subset Construction Formalized

✓ Input: An NFA  $(\Sigma, Q, \rightarrow, q_0, F)$

✓ Output: A DFA  $(\Sigma, \mathcal{P}(Q), \rightarrow', q_0', F')$

✓ Definition?

# Regular Expressions

- ✓ What are the “primitive” regular expressions?
- ✓ What other regular expression forms have you seen?

M[ou]'?am+[ae]r . \* ([AEae]l[- ])?[GKQ]h?[aeu]+([dtz][dhz]?)+af[iy]

from the RX Library

# Exercise

1. Give a regular expression for C identifiers:

✓ Can contain letters, digits, and underscores

✓ Must begin with a letter or underscore.

```
main  
__Z6rotateiii
```

2. Give a regular expression for Ada identifiers:

✓ Can contain letters, digits, and underscores ( \_ )

✓ Must begin with a letter

✓ Have no consecutive underscores or an underscore at the end

```
woohoo32  
Last_Nonzero_Row
```

# From Automata to Regexp

✓ Two approaches

✓ Solving equations

✓ Generalized NFAs

# The Language of a State

- ✓ Let  $L_q$  be the set of strings are accepted when starting from state  $q$ .
- ✓ What is  $L_{q_0}$ ,  $L_{q_1}$ ,  $L_{q_2}$ , ...?
- ✓ How is  $L_{q_1}$  related to  $L_{q_2}$ ?

# Example

✓  $L_A = \epsilon L_B \mid b L_D$

✓  $L_B =$

✓  $L_C =$

✓  $L_D =$

# Solving Equations using Arden's Rule

✓ The equation

$$L = AL \mid B$$

with  $A$  and  $B$  being languages and  $L$  an unknown  
has the solution

$$L = A^* B$$

✓ This is the smallest solution.

✓ If  $\epsilon \notin A$ , this solution is unique.

✓ Otherwise,  $A^* C$  is a solution for any  $B \subseteq C$ .

$$L_A = L_B \mid bL_D$$

$$L_B = \epsilon \mid bL_A \mid aL_C$$

$$L_C = \epsilon \mid aL_D$$

$$L_D = [ab]L_D \mid bL_C$$

# Generalized NFAs

- ✓ Just like an NFA, but edges have regular expressions rather than single symbols

- ✓ Since regular expressions can be turned into NFAs, we aren't adding any extra power.

# Removing States

✓ Pick a state  $q$  to remove.

✓ For every incoming/outgoing pair

✓ replace by the direct edge

# Representing Regular Languages: Conclusion

# Closure Properties

- ✓ A family of languages is a set of languages.
  - ✓ The family of all finite languages
  - ✓ The family of all languages
  - ✓ The family of all regular languages
- ✓ A family  $F$  is closed under an operation if applying the operation to languages in  $F$  always produces a result in  $F$ .

# Example: Finite Languages

✓ Are the finite languages closed under:

✓ Union? ( $A \cup B$ )

✓ Intersection? ( $A \cap B$ )

✓ Concatenation ( $AB$ )

✓ Star? ( $A^*$ )

✓ Complement? ( $A^c$ )

# Closure Properties for Regular Languages

- ✓ Regular languages are closed under
  - ✓ Concatenation
  - ✓ Union
  - ✓ Star
  - ✓ Complement
  - ✓ Intersection
- ✓ Proofs: Consider the corresponding automata...

# Complement?

# Complement

# Intersection
