

(Imperative) Program Logic Part 2

Robert Keller
February 2011

Recall the **while** rule

- In order to use the while rule in JAPE, it is necessary to supply an **invariant**, I .

$$\{I \wedge P\} S \{I\}$$

$$\{I\} \mathbf{while}(P) S \{I \wedge \neg P\}$$

Inferring invariants

- There is no fully general automation for inferring invariants (as there is for the weakest pre-condition/assumption for assignment statements).
- This is one of the things that makes totally automated verification difficult.
- Finding the right invariant is still a human intellectual activity.

Using the **while** rule

- In JAPE, an assertion **implying** the invariant (by using the consequent(L) rule) is included as an assertion before the while, and also doubly serves as a post-condition for the preceding statement.

(What does this code do?)

```
...  
{i=Ki ∧ j=Kj ∧ i ≥ 0}(k:=0)  
1: {i ≥ 0 ∧ k + i × j = Ki × Kj}  
while i ≠ 0 do k := k + j; i := i - 1 od  
{k = Ki × Kj}
```

Should imply the invariant

Invariant and negation of test should imply this.

Using the **while** rule

- Before using Jape's while rule, this setup is decomposed using Jape's **Ntuple** rule.

$1: \{i=Ki \wedge j=Kj \wedge i \geq 0\}(k:=0)$ $\{i \geq 0 \wedge k+i \times j=Ki \times Kj\}$...	Prove using assignment rule
<hr/> $\{i \geq 0 \wedge k+i \times j=Ki \times Kj\}$ $2: \text{while } i \neq 0 \text{ do } k:=k+j; i:=i-1 \text{ od}$ $\{k=Ki \times Kj\}$	Prove using while rule
<hr/> $\{i=Ki \wedge j=Kj \wedge i \geq 0\}(k:=0)$ $3: \{i \geq 0 \wedge k+i \times j=Ki \times Kj\}$ $\text{while } i \neq 0 \text{ do } k:=k+j; i:=i-1 \text{ od}$ $\{k=Ki \times Kj\}$	Ntuple rule used Ntuple 1,2 

A proof of a simple program

1: $i=10 \wedge i>0$	assumption
2: $i-1=10$	obviously
3: $i=10 \wedge i>0 \rightarrow i-1=10$	\rightarrow intro 1-2
4: $\{i-1=10\}(i:=i-1)\{i=10\}$	variable-assignment
5: $\{i=10 \wedge i>0\}(i:=i-1)\{i=10\}$	consequence(L) 3,4
6: $i=10 \wedge i>0$	assumption
7: $i>0$	\wedge elim 6
8: $i=10 \wedge i>0 \rightarrow i>0$	\rightarrow intro 6-7
9: integer Km	assumption
10: $i=10 \wedge i>0 \wedge i=Km$	assumption
11: $i-1 < Km$	obviously
12: $i=10 \wedge i>0 \wedge i=Km \rightarrow i-1 < Km$	\rightarrow intro 10-11
13: $\{i-1 < Km\}(i:=i-1)\{i < Km\}$	variable-assignment
14: $\{i=10 \wedge i>0 \wedge i=Km\}(i:=i-1)\{i < Km\}$	consequence(L) 12,13
15: $\{i=10\}\text{while } i>0 \text{ do } i:=i-1 \text{ od}\{i=10 \wedge \neg(i>0)\}$	while 5,8,9-14
16: $i=10 \wedge \neg(i>0) \rightarrow i=0$	obviously
17: $\{i=10\}(\text{while } i>0 \text{ do } i:=i-1 \text{ od})\{i=0\}$	consequence(R) 15,16

Subtleties about loop invariants

- Can the following be proved?

```
...  
1: {y=0 ∧ i=0 ∧ n ≥ 0} (j:=1) {y=i×i ∧ i ≤ n ∧ i ≥ 0}  
   while i < n do y:=y+j; j:=j+2; i:=i+1 od {y=n×n}
```

Provided:

DISTINCT i, j, n, y

The loop invariant is not strong enough to enable induction

- This is more likely provable.

...

```
1: {y=0 ∧ i=0 ∧ n ≥ 0} (j:=1) {y=i×i ∧ i ≤ n ∧ i ≥ 0 ∧ j=2×i+1}
   while i < n do y:=y+j; j:=j+2; i:=i+1 od {y=n×n}
```

Provided:

DISTINCT i, j, n, y

- What is $_M$ for termination?

...

```
1: {y=0 ∧ i=0 ∧ n ≥ 0} (j:=1) {y=i×i ∧ i ≤ n ∧ i ≥ 0 ∧ j=2×i+1}
   while i < n do y:=y+j; j:=j+2; i:=i+1 od {y=n×n}
```

Provided:

DISTINCT i, j, n, y

Verifying Array Programs

- Arrays present extra challenges and interesting issues.
- A useful dichotomy:
 - Programs with read-only arrays
 - Programs with modifiable arrays

Array Mathematics

- An array can be treated as a **function**:
 - It maps indices into values.
 - e.g. a 1-dimensional array with dimension 10 maps $\{0, \dots, 9\}$ into values of the type stored in the array.
 - $a[i]$ is the value of this function with argument i
- Because several indices can have the same value, arrays are more susceptible to variable **aliasing**, e.g.

$$i := 5; j = 6-1; a[j] = a[i]+1$$

Read-Only Array Example

This program sets j to the last index i such that $a[i] = 0$.
The array is assumed to be indexed $0..n-1$.
If there is no such value, it leaves j at its initial value n .

$\{n \geq 0 \wedge \text{length}(a)=n\}$

```
i := 0;
j := n;
while i < n
do
  if a[i] = 0
  then j := i
  else skip
fi
i := i+1
od
```

What invariant do we need?

$\{j < n \rightarrow a[j] = 0\}$

Read-Only Array Example

This program sets j to the last index i such that $a[i] = 0$.
The array is assumed to be indexed $0..n-1$.
If there is no such value, it leaves j at its initial value n .

```
...
assumption { $n \geq 0 \wedge \text{length}(a) = n$ }
program (i:=0; j:=n)
invariant { $i \leq n \wedge i \geq 0 \wedge \text{length}(a) = n \wedge (j < n \rightarrow a[j] = 0)$ }
1: while i < n do if a[i]=0 then j:=i else skip fi; i:=i+1 od
expectation {j < n  $\rightarrow$  a[j]=0}
```

Provided:

DISTINCT a, i, j, n

Quantifiers

- Quantifiers are handy representing information about arrays, e.g.
- $\forall i ((0 < i) \wedge (i < n)) \rightarrow a[i-1] \leq a[i]$
- $\exists i ((0 \leq i) \wedge (i < n) \wedge a[i] = 0)$

Subtleties with Array Programs

$\{\exists x.(0 \leq x \wedge x < \text{length}(a) \wedge a[x]=0)\}(i:=0)$

$\{0 \leq i \wedge i < \text{length}(a) \wedge \exists x.(i \leq x \wedge x < \text{length}(a) \wedge a[x]=0)\}$ while $a[i] \neq 0$ do $i:=i+1$ od $\{a[i]=0\}$

- Look at part of the invariant here.
- Note that the lower bound on x is a function of the index i .
- This is important, because it says that the element such that **$a[x] = 0$ is yet to be found.**
- We need this invariant to prove termination.
- The loop test will stop when $a[i] = 0$.
- The expansion order is tricky.

Quantifier Example Proved

- Things go pretty routinely, until this ...

```
3:  $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \wedge a[i] \neq 0$   
4:  $0 \leq i$   
5:  $i < \text{length}(a)$   
6:  $\exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$   
7:  $a[i] \neq 0$   
...  
8:  $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$ 
```

How do we get $i+1 < \text{length}(a)$?

\exists -elimination to the rescue

- 3: $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \wedge a[i] \neq 0$
- 4: $0 \leq i$
- 5: $i < \text{length}(a)$
- 6: $\exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$
- 7: $a[i] \neq 0$
- 8: integer $i1$, $i \leq i1 \wedge i1 < \text{length}(a) \wedge a[i1] = 0$
- ...
- 9: $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$
- 10: $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$

Now case analysis

3: $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \wedge a[i] \neq 0$
4: $0 \leq i$
5: $i < \text{length}(a)$
6: $\exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$
7: $a[i] \neq 0$
8: integer $i1$, $i \leq i1 \wedge i1 < \text{length}(a) \wedge a[i1] = 0$
9: $i \leq i1$
10: $i1 < \text{length}(a)$
11: $a[i1] = 0$
...
12: $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$
13: $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$

Setting up for case analysis

```
3:  $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \wedge a[i] \neq 0$   
4:  $0 \leq i$   
5:  $i < \text{length}(a)$   
6:  $\exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$   
7:  $a[i] \neq 0$   
8: integer  $i1, i \leq i1 \wedge i1 < \text{length}(a) \wedge a[i1] = 0$   
9:  $i \leq i1$   
10:  $i1 < \text{length}(a)$   
11:  $a[i1] = 0$   
12:  $i < i1 \vee i = i1$  from 9  
...  
13:  $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$   
14:  $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$ 
```

Strategy: v -Elimination

```
3:  $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x]=0) \wedge a[i] \neq 0$

Modifiable Arrays

- Arrays are like functions
- Assigning to an array element is like creating a new function.
- The new function differs from the old in that one element may be different from before.
- Jape Notation: $a \oplus i \rightarrow v$ is the array that is like a except that the value of $a[i]$ is v .
- So $(a \oplus i \rightarrow v)[i] = v$, and
 $(a \oplus i \rightarrow v)[j] = a[j]$ if $j \neq i$.

Jape's Indexing rules

- $(a \oplus i \rightarrow v)[i] = v$, and
 $(a \oplus i \rightarrow v)[j] = a[j]$ if $j \neq i$.
- Two rules below capture the two cases preceding.
 - The first rule simplifies an array modification expression when the index of the new array is provably **the same** as the index to which assignment was done.
 - The second rule simplifies in the case of a **different** index.
- The buttons indicate the direction of substitution.

Array Bounds Guarantees

- If an array index value is used in an assumption, the same index value can be used later on without requiring a bounds check.
- Sub-formula select a hypothesis using the desired index.

The screenshot shows a theorem prover interface with a menu open over a list of hypotheses. The hypotheses are:

- 1: $a[i]=2$ (assumption)
- 2: $(a \oplus i \rightarrow a[i+1])[i]=3$
- 3: $0 \leq i$
- 4: $i < \text{length}(a)$
- 5: $(a \oplus i \rightarrow a[i+1])[i]=3 \wedge 0 \leq i \wedge i < \text{length}(a)$ (\wedge intro 2,3,4)

The context menu is open, showing options: $A=A$, $A = ..$, $.. = B$, obviously, and **boundedness from (in)equality** (highlighted). A red arrow points to the highlighted option.

Result:

- 1: $a[i]=2$ (assumption)
- 2: $0 \leq i \wedge i < \text{length}(a)$ (bounded 1)

Using the Array Rule

- Make sure the entire array sub-expression is sub-formula selected.
- It should match the form in the rule in the menu:

The screenshot shows a theorem prover interface with a proof script on the left and a rule menu on the right. The proof script contains the following lines:

```

1: a[i]=2
2: 0 ≤ i ∧ i < length(a)
3: 0 ≤ i
4: i < length(a)
...
5: (a ⊕ i → a[i+1])[i]=3
6: (a ⊕ i → a[i+1])[i]=3 ∧ 0 ≤ i ∧ i < length(a)
7: a[i]=2 → (a ⊕ i → a[i+1])[i]=3 ∧ 0 ≤ i ∧ i < length(a)
8: {(a ⊕ i → a[i+1])[i]=3 ∧ 0 ≤ i ∧ i < length(a)}{a[i]:=a[i+1]}{a[i]=3} array-element-assignment
9: {a[i]=2}{a[i]:=a[i+1]}{a[i]=3} consequence(L) 7,8
  
```

A red arrow points to line 5, where the sub-expression $(a \oplus i \rightarrow a[i+1])[i]=3$ is highlighted in yellow. A red box highlights the corresponding rule in the menu:

```

FROM E=G INFER (A ⊕ E → F)[G]=F
FROM E≠G INFER (A ⊕ E → F)[G]=A[G]
  
```

The menu also shows buttons for $A = \dots$ and $\dots = B$.

Here we identify:
 A with a
 E with i
 F with a[i]+1
 [G] with [i]
 (so E = G).

Using the Equality Rule

- Two selections and a sub-formula selection are needed:
 - Selection an equality hypothesis and a goal.
 - Sub-formula select an instance of the LHS of the equality.

hyp.

instance

goal

The screenshot shows a theorem prover interface with a menu bar (Backward, Forward, Programs, Extras, Window, Help) and a list of hypotheses and goals. The hypothesis list contains:
1: $a[i]=2$
2: $0 \leq i \wedge i < \text{length}(a)$
3: $0 \leq i$
4: $i < \text{length}(a)$
...
5: $a[i]+1=3$
6: $(\lambda \oplus i \mapsto a[i]+1)[i]=3$
The goal list contains:
assumption
bounded 1
 \wedge elim 2
 \wedge elim 2
FROM E=G INFER (A \oplus E \mapsto F)[... 5
A context menu is open over the hypothesis list, showing options: A=A, A = .. (highlighted), .. = B, obviously, and boundedness from (in)equality. Red arrows point from the labels 'hyp.', 'instance', and 'goal' to the corresponding elements in the list.

Result of the Equality Rule

...	
5: $2+1=3$	
6: $a[i]+1=3$	equality-substitution 1,5
7: $(a \oplus i \mapsto a[i]+1)[i]=3$	FROM $E=G$ INFER $(A \oplus E \mapsto F)[G... 6$
8: $(a \oplus i \mapsto a[i]+1)[i]=3 \wedge 0 \leq i \wedge i < \text{length}(a)$	\wedge intro 7,3,4
9: $a[i]=2 \rightarrow (a \oplus i \mapsto a[i]+1)[i]=3 \wedge 0 \leq i \wedge i < \text{length}(a)$	\rightarrow intro 1-8
10: $\{(a \oplus i \mapsto a[i]+1)[i]=3 \wedge 0 \leq i \wedge i < \text{length}(a)\}(a[i]:=a[i]+1)\{a[i]=3\}$	array-element-assignment
11: $\{a[i]=2\}(a[i]:=a[i]+1)\{a[i]=3\}$	consequence(L) 9,10

The top simple equation
can be justified by “obviously”.

Summary: Jape proof with array modification

11: $\{a[i]=2\} (a[i]:=a[i]+1) \{a[i]=3\}$		consequence(L) 9,10

How to get these rules to work in the GUI (It isn't so obvious.)

- Looking at the 2nd provided array program example, we use sequence, then array-assignment twice (from the bottom up) to get to this point:

```
{a[i]=0}{a[i]:=a[i]+1;a[i]:=a[i]+1}{a[i]=2} [1]
```

...

1: $a[i]=0 \rightarrow (a \oplus i \rightarrow a[i]+1 \oplus i \rightarrow (a \oplus i \rightarrow a[i]+1)[i]+1)[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)$	
2: $\{(a \oplus i \rightarrow a[i]+1 \oplus i \rightarrow (a \oplus i \rightarrow a[i]+1)[i]+1)[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)\}$ $(a[i]:=a[i]+1)\{(a \oplus i \rightarrow a[i]+1)[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)\}$	array-element-assignment
3: $\{a[i]=0\}(a[i]:=a[i]+1)\{(a \oplus i \rightarrow a[i]+1)[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)\}$	consequence(L) 1,2
4: $\{(a \oplus i \rightarrow a[i]+1)[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)\}(a[i]:=a[i]+1)\{a[i]=2\}$	array-element-assignment
5: $\{a[i]=0\}(a[i]:=a[i]+1;a[i]:=a[i]+1)\{a[i]=2\}$	sequence 3,4

Provided:
DISTINCT a, i

How to use GUI (continued)

- The top line is pure logic, so we expand using \rightarrow Introduction and \wedge Introduction:

1: $a[i]=0$	assumption
...	
2: $(a \oplus i \mapsto a[i]+1 \oplus i \mapsto (a \oplus i \mapsto a[i]+1)[i+1])[i]=2$	
...	
3: $0 \leq i$	
...	
4: $i < \text{length}(a)$	
5: $(a \oplus i \mapsto a[i]+1 \oplus i \mapsto (a \oplus i \mapsto a[i]+1)[i+1])[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)$	\wedge intro 2,3,4
6: $a[i]=0 \rightarrow (a \oplus i \mapsto a[i]+1 \oplus i \mapsto (a \oplus i \mapsto a[i]+1)[i+1])[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)$	\rightarrow intro 1-5

How to use GUI (continued)

- We then conclude the two array index bounds (lines 4, 5) by \wedge Elimination, giving:

1: $a[i]=0$	assumption
...	
2: $(a \oplus i \mapsto a[i]+1 \oplus i \mapsto (a \oplus i \mapsto a[i]+1)[i]+1)[i]=2$	
3: $0 \leq i \wedge i < \text{length}(a)$	bounded 1
4: $0 \leq i$	\wedge elim 3
5: $i < \text{length}(a)$	\wedge elim 3
6: $(a \oplus i \mapsto a[i]+1 \oplus i \mapsto (a \oplus i \mapsto a[i]+1)[i]+1)[i]=2 \wedge 0 \leq i \wedge i < \text{length}(a)$	\wedge intro 2,4,5

How to use GUI (continued)

- We are left with a nested array-modification expression. *Carefully* sub-formula select the outer array-modification and apply the rule shown (since we have $a \oplus i \rightarrow \dots[i]$). Do not have anything else (such as a goal) selected.

giving:

<pre> 1: a[i]=0 ... 2: (a ⊕ i → a[i]+1)[i+1]=2 3: (a ⊕ i → a[i]+1 ⊕ i → (a ⊕ i → a[i]+1)[i+1])[i]=2 </pre>	<p>assumption</p> <p>FROM E=G INFER (A ⊕ E → F)[G]=F 2</p>
--	--

How to use GUI (continued)

- Repeat the preceding process on the new formula:

The screenshot shows a window with a list of formulas:

```
1: a[i]=0
...
2: (a ⊕ i → a[i+1])[i] + 1 = 2
3: (a ⊕ i → a[i+1] ⊕ i → (a ⊕ i → a[i+1])[i+1])[i] = 2
```

Two red arrows point from the first and second lines of the list to the 'Indexing' dialog box. The dialog box has the title 'Indexing' and contains the following text:

```
FROM E=G INFER (A ⊕ E → F)[G]=F
FROM E≠G INFER (A ⊕ E → F)[G]=A[G]
```

Below the text are two buttons: 'A = ...' and '... = B'. At the bottom of the dialog box, there is a line of text: 'FROM E=G INFER (A ⊕ E → F)[G]=F 2'.

giving: 

The screenshot shows a window with a list of formulas:

```
1: a[i]=0
...
2: a[i] + 1 + 1 = 2
```

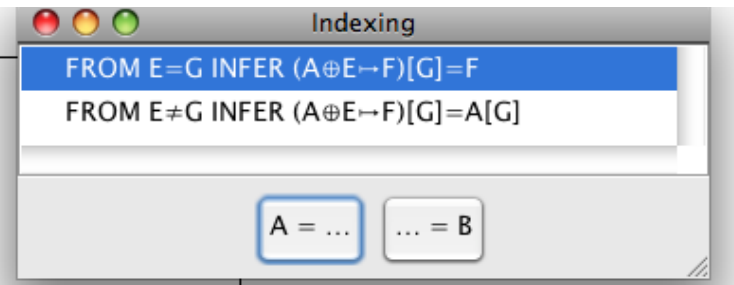

To the right of the list, the word 'assumption' is written.

How to use GUI (continued)

- Alternatively we could have selected the *inner* modification expression first:

```

1: a[i]=0
...
2: (a⊕i→a[i]+1 ⊕i→(a⊕i→a[i]+1)[i]+1)[i]=2
3: 0≤i∧i<length(a)
  
```

giving: 

```

1: a[i]=0
...
2: (a⊕i→a[i]+1 ⊕i→a[i]+1+1)[i]=2
3: (a⊕i→a[i]+1 ⊕i→(a⊕i→a[i]+1)[i]+1)[i]=2
  
```

assumption

FROM E=G INFER (A⊕E→F)[G]=F 2

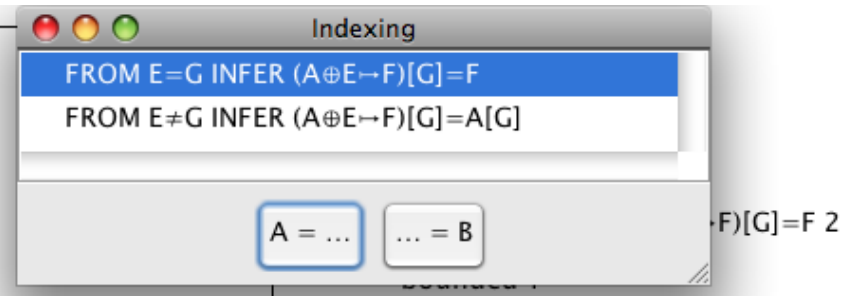

How to use GUI (continued)

- (Note that this is different from two slides ago). Then simplify that result:

```

1: a[i]=0
...
2: (a⊕i→a[i]+1⊕i→a[i]+1+1)[i]=2
3: (a⊕i→a[i]+1⊕i→(a⊕i→a[i]+1)[i]+1)[i]=2
4: 0≤i∧i<length(a)

```

giving (as before): 

```

1: a[i]=0
...
2: a[i]+1+1=2
3: (a⊕i→a[i]+1⊕i→a[i]+1+1)[i]=2
4: (a⊕i→a[i]+1⊕i→(a⊕i→a[i]+1)[i]+1)[i]=2

```

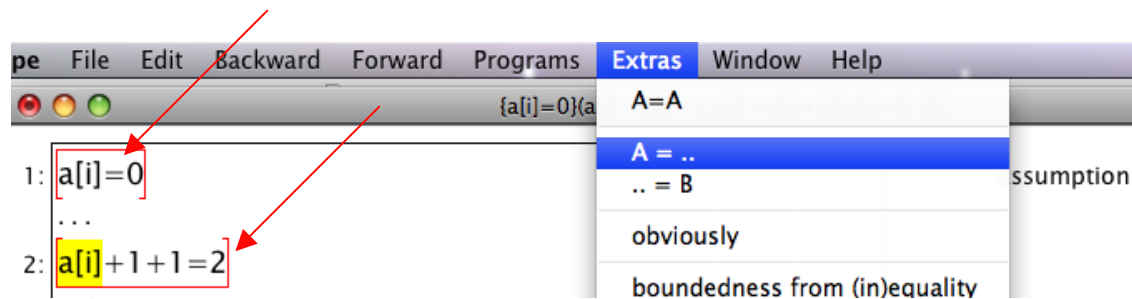

assumption

FROM E=G INFER (A⊕E→F)[G]=F 2

FROM E=G INFER (A⊕E→F)[G]=F 3

How to use GUI (continued)

- Use plain equality substitution to simplify the new goal. Note that both the goal and the equation defining the substitution are selected, and the sub-formula for which substitution is to occur is sub-formula selected (3 selections).

giving:

↓

original program

Provided:

DISTINCT a, i

The following are more detail on an earlier example.

$\{\exists x.(0 \leq x \wedge x < \text{length}(a) \wedge a[x]=0)\}(i:=0)$

$\{0 \leq i \wedge i < \text{length}(a) \wedge \exists x.(i \leq x \wedge x < \text{length}(a) \wedge a[x]=0)\}$ while $a[i] \neq 0$ do $i:=i+1$ od $\{a[i]=0\}$

- Look at part of the invariant here.
- Note that the lower bound on x is a function of the index i .
- This is important, because it says that the element such that **$a[x] = 0$ is yet to be found.**
- We need this invariant to prove termination.
- The loop test will stop when $a[i] = 0$.
- The expansion order is tricky.

Key Step #1: Split $i \leq i1$

2: $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \rightarrow 0 \leq i \wedge i < \text{length}(a)$

3: $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \wedge a[i] \neq 0$

4: $0 \leq i$

5: $i < \text{length}(a)$

6: $\exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$

7: $a[i] \neq 0$

8: integer $i1$

9: $i \leq i1 \wedge i1 < \text{length}(a) \wedge a[i1] = 0$

10: $i \leq i1$

11: $i < i1 \vee i = i1$

12: $i1 < \text{length}(a)$

13: $a[i1] = 0$

...

14: $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$

15: $0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$

16: $0 \leq i \wedge i < \text{length}(a) \wedge \exists x. (i \leq x \wedge x < \text{length}(a) \wedge a[x] = 0) \wedge a[i] \neq 0$

$\rightarrow 0 \leq i+1 \wedge i+1 < \text{length}(a) \wedge \exists x. (i+1 \leq x \wedge x < \text{length}(a) \wedge a[x] = 0)$
