

CS81 Spring 2012 NOTES ON MISPROOFS

This is a collection of some subtle but perhaps common missteps in proofs within Natural Deduction. We follow Huth and Ryan's (page 113) treatment of $\exists\mathcal{E}$ as a disjunction elimination. This interpretation has the benefit of forcing the instantiation into an explicit assumption (by bringing anything else attached to that assumption along).

Remark: These notes are perpetually under construction. Consider contributing examples which you think are constructive. Please consult the revised set of rules on Natural Deduction or Buss' survey chapter on First-Order Logic.

1. Generalization:

1	$(\forall x)[P(x) \vee Q(x)]$	premise		
2	$P(a) \vee Q(a)$	$\forall\mathcal{E}, 1$		
3	<table style="border-collapse: collapse; margin-left: auto; margin-right: auto;"> <tr> <td style="border-left: 1px solid black; padding-left: 10px; vertical-align: top;">$P(a)$</td> <td style="padding-left: 10px; vertical-align: top;">assumption</td> </tr> </table>	$P(a)$	assumption	
$P(a)$	assumption			
4	<table style="border-collapse: collapse; margin-left: auto; margin-right: auto;"> <tr> <td style="border-left: 1px solid black; padding-left: 10px; vertical-align: top;">$(\forall x)P(x)$</td> <td style="padding-left: 10px; vertical-align: top;">$\forall\mathcal{I}$ mistake, 3</td> </tr> </table>	$(\forall x)P(x)$	$\forall\mathcal{I}$ mistake , 3	
$(\forall x)P(x)$	$\forall\mathcal{I}$ mistake , 3			
5	$(\forall x)P(x) \vee (\forall x)Q(x)$	$\forall\mathcal{I}_1, 4$		
6	<table style="border-collapse: collapse; margin-left: auto; margin-right: auto;"> <tr> <td style="border-left: 1px solid black; padding-left: 10px; vertical-align: top;">$Q(a)$</td> <td style="padding-left: 10px; vertical-align: top;">assumption</td> </tr> </table>	$Q(a)$	assumption	
$Q(a)$	assumption			
7	<table style="border-collapse: collapse; margin-left: auto; margin-right: auto;"> <tr> <td style="border-left: 1px solid black; padding-left: 10px; vertical-align: top;">$(\forall x)Q(x)$</td> <td style="padding-left: 10px; vertical-align: top;">$\forall\mathcal{I}$ mistake, 6</td> </tr> </table>	$(\forall x)Q(x)$	$\forall\mathcal{I}$ mistake , 6	
$(\forall x)Q(x)$	$\forall\mathcal{I}$ mistake , 6			
8	$(\forall x)P(x) \vee (\forall x)Q(x)$	$\forall\mathcal{I}_2, 7$		
9	$(\forall x)P(x) \vee (\forall x)Q(x)$	$\forall\mathcal{E}, 2, 3-5, 6-8$		

The mistake is that a is not free when $\forall\mathcal{I}$ is applied since it is involved in an unfinished assumption $P(a)$ (and $Q(a)$).

Contrast this with the following derivation

1		$(\forall x)(\exists y)[P(x) \rightarrow Q(y)]$	premise
2		$P(a)$	assumption
3		$(\exists y)[P(a) \rightarrow Q(y)]$	$\forall\mathcal{E}$, 1
4		$P(a) \rightarrow Q(\hat{b})$	$\exists\mathcal{E}$, 2
5		$Q(\hat{b})$	Modus Ponens, 2, 4
6		$(\exists y)Q(y)$	$\exists\mathcal{I}$, 5
7		$(\exists y)Q(y)$	$\exists\mathcal{E}$, 3
8	$P(a) \rightarrow (\exists y)Q(y)$	$\Rightarrow \mathcal{I}$, 2–7	
9		$(\forall x)[P(x) \rightarrow (\exists y)Q(y)]$	$\forall\mathcal{I}$, 8

Here, applying $\forall\mathcal{I}$ on a on line 8 is valid since the assumption $P(a)$ on line 2 was already discharged.

2. Elimination:

1		$(\exists x)P(x) \wedge (\exists x)Q(x)$	premise
2		$(\exists x)P(x)$	$\wedge\mathcal{E}_1$, 1
3		$P(\hat{a})$	assumption
4		$(\exists x)Q(x)$	$\wedge\mathcal{E}_2$, 1
5		$Q(\hat{a})$	$\exists\mathcal{E}$ mistake : \hat{a} is not free
6		$P(\hat{a}) \wedge Q(\hat{a})$	$\wedge\mathcal{I}$, 3, 5
7		$(\exists x)[P(x) \wedge Q(x)]$	$\exists\mathcal{I}$, 6
8		$(\exists x)[P(x) \wedge Q(x)]$	$\exists\mathcal{E}$, 4, 5–7
9		$(\exists x)[P(x) \wedge Q(x)]$	$\exists\mathcal{E}$, 2, 3–8

This mistake appears since \hat{a} (on line 5) is involved in an unfinished assumption (on line 3).

3. Ordering:

1	$(\forall x)(\exists y)[P(x) \rightarrow Q(y)]$	premise
2	$(\forall x)[P(x) \rightarrow Q(\hat{a})]$	$\exists\mathcal{E}$ mistake: ordering
3	$(\exists y)(\forall x)[P(x) \rightarrow Q(y)]$	$\exists\mathcal{I}$, 2

The mistake is that $(\exists y)$ cannot be eliminated before $(\forall x)$ is eliminated.

4. Scoping:

1	$(\forall x)(\exists y)[P(x) \rightarrow Q(y)]$	premise			
2	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">2</td> <td style="border-left: 1px solid black; padding-left: 10px;">$P(a)$</td> <td style="padding-left: 20px;">assumption</td> </tr> </table>	2	$P(a)$	assumption	
2	$P(a)$	assumption			
3	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">3</td> <td style="border-left: 1px solid black; padding-left: 10px;">$(\exists y)[P(a) \rightarrow Q(y)]$</td> <td style="padding-left: 20px;">$\forall\mathcal{E}$, 1</td> </tr> </table>	3	$(\exists y)[P(a) \rightarrow Q(y)]$	$\forall\mathcal{E}$, 1	
3	$(\exists y)[P(a) \rightarrow Q(y)]$	$\forall\mathcal{E}$, 1			
4	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">4</td> <td style="border-left: 1px solid black; padding-left: 10px;">$P(a) \rightarrow Q(\hat{b})$</td> <td style="padding-left: 20px;">$\exists\mathcal{E}$, 2</td> </tr> </table>	4	$P(a) \rightarrow Q(\hat{b})$	$\exists\mathcal{E}$, 2	
4	$P(a) \rightarrow Q(\hat{b})$	$\exists\mathcal{E}$, 2			
5	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">5</td> <td style="border-left: 1px solid black; padding-left: 10px;">$Q(\hat{b})$</td> <td style="padding-left: 20px;">Modus Ponens, 2, 4</td> </tr> </table>	5	$Q(\hat{b})$	Modus Ponens, 2, 4	
5	$Q(\hat{b})$	Modus Ponens, 2, 4			
6	$Q(\hat{b})$	copy mistake: out of bounds, 5			
7	$(\exists y)Q(y)$	$\exists\mathcal{I}$, 6			

The mistake is that $Q(\hat{b})$ left the enclosed scope of the assumption $P(a)$.

5. Implicit Binding:

1	$(\forall x)(\exists y)[P(x) \rightarrow Q(y)]$	premise			
2	$(\exists y)[P(a) \rightarrow Q(y)]$	$\forall\mathcal{E}$, 1			
3	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">3</td> <td style="border-left: 1px solid black; padding-left: 10px;">$P(a) \rightarrow Q(\hat{b})$</td> <td style="padding-left: 20px;">assumption</td> </tr> </table>	3	$P(a) \rightarrow Q(\hat{b})$	assumption	
3	$P(a) \rightarrow Q(\hat{b})$	assumption			
4	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">4</td> <td style="border-left: 1px solid black; padding-left: 10px;">$(\forall x)[P(x) \rightarrow Q(\hat{b})]$</td> <td style="padding-left: 20px;">$\forall\mathcal{I}$ mistake: a is under assumption, 3</td> </tr> </table>	4	$(\forall x)[P(x) \rightarrow Q(\hat{b})]$	$\forall\mathcal{I}$ mistake: a is under assumption, 3	
4	$(\forall x)[P(x) \rightarrow Q(\hat{b})]$	$\forall\mathcal{I}$ mistake: a is under assumption, 3			
5	<table style="border-collapse: collapse; margin-left: 20px;"> <tr> <td style="padding-right: 10px;">5</td> <td style="border-left: 1px solid black; padding-left: 10px;">$(\exists y)(\forall x)[P(x) \rightarrow Q(y)]$</td> <td style="padding-left: 20px;">$\exists\mathcal{I}$, 4</td> </tr> </table>	5	$(\exists y)(\forall x)[P(x) \rightarrow Q(y)]$	$\exists\mathcal{I}$, 4	
5	$(\exists y)(\forall x)[P(x) \rightarrow Q(y)]$	$\exists\mathcal{I}$, 4			
6	$(\exists y)(\forall x)[P(x) \rightarrow Q(y)]$	$\exists\mathcal{E}$, 2			

This binding of a to \hat{b} is only *implicitly* apparent in the *flat* interpretation of $\exists\mathcal{E}$.

1	$(\forall x)(\exists y)[P(x) \rightarrow Q(y)]$	premise
2	$(\exists y)[P(a) \rightarrow Q(y)]$	$\forall\mathcal{E}, 1$
3	$P(a) \rightarrow Q(\hat{b})$	$\exists\mathcal{E}, 2$
4	$(\forall x)[P(x) \rightarrow Q(\hat{b})]$	$\forall\mathcal{I}$ mistake: a is bound to \hat{b} , 3
5	$(\exists y)(\forall x)[P(x) \rightarrow Q(y)]$	$\exists\mathcal{I}, 4$

Contrast these with the following derivation:

1	$(\forall x)(\forall y)[P(x) \rightarrow Q(y)]$	premise
2	$(\forall y)[P(a) \rightarrow Q(y)]$	$\forall\mathcal{E}, 1$
3	$P(a) \rightarrow Q(b)$	$\forall\mathcal{E}, 2$
4	$(\forall x)[P(x) \rightarrow Q(b)]$	$\forall\mathcal{I}, 3$
5	$(\forall y)(\forall x)[P(x) \rightarrow Q(y)]$	$\forall\mathcal{I}, 4$

Here a was not involved in any unfinished assumption when $\forall\mathcal{I}$ was applied on line 4.
