Mapping commands to the keyboard

The “when key pressed” block is a __________________ block. It __________ a script when a button on the __________________ is pressed. It has 1 variable:

1. You can change ____________________________ will start the script.

The “when key pressed” block only works at the ______________________ of a script. (You can think of it as a “hat” for the script.)

To control a script with the keyboard, place a “when key pressed” block on _________ of it and ______________ which key will run the script.

When a key on the keyboard starts a script, we say that script has been “_________________” to that key.
